A Map of the Island of Sumatra in the East Indies by W. Herman
THE HISTORY OF SUMATRA,
CONTAINING AN ACCOUNT OF
THE GOVERNMENT, LAWS, CUSTOMS, AND MANNERS
OF
THE NATIVE INHABITANTS,
WITH
A DESCRIPTION OF THE NATURAL PRODUCTIONS,
AND A RELATION OF THE
ANCIENT POLITICAL STATE OF THAT ISLAND.

BY WILLIAM MARSDEN, F.R.S.

THE THIRD EDITION, WITH CORRECTIONS, ADDITIONS, AND PLATES.

LONDON:
PRINTED FOR THE AUTHOR,
BY J. MACREERY, BLACK-HORSE-COURT,
AND SOLD BY
LONGMAN, HURST, REES, ORME, AND BROWN, PATERNOSTER-ROW.
1811.
PREFACE.

The island of Sumatra, which, in point of situation and extent, holds a conspicuous rank on the terraqueous globe, and is surpassed by few in the bountiful indulgences of nature, has in all ages been unaccountably neglected by writers; insomuch, that it is at this day less known, as to the interior parts more especially, that the remotest island of modern discovery; although it has been constantly resorted to by Europeans for some centuries, and the English have had a regular establishment there for the last hundred years. It is true that the commercial importance of Sumatra has much declined. It is no longer the Emporium of Eastern riches, whither the traders of the West resorted with their cargoes, to exchange them for the precious merchandise of the Indian Archipelago: nor does it boast now the political consequence it acquired, when the rapid progress of the Portuguese successes there first received a check. That enterprising people, who caused so many kingdoms to shrink from the terrore of their arms, met with nothing but disgrace in their attempts against Achin, whose monarchs made them tremble in their turn. Yet still the importance of this island, in the eye of the natural historian, has continued undiminished, and has equally, at all periods, laid claim to an attention, that does not appear, at any, to have been paid to it.

The Portuguese being better warriors than philosophers, and more
eager to conquer nations than to explore their manners or antiquities, it is not surprising that they should have been unable to furnish the world with any particular and just description of a country which they must have regarded with an evil eye. The Dutch were the next people from whom we had a right to expect information. They had an early intercourse with the island, and have at different times formed settlements in almost every part of it; yet they are almost silent with respect to its history.* But to what cause are we to ascribe the remissness of our own countrymen, whose opportunities have been equal to those of their predecessors or cotemporaries? It seems difficult to account for it; but the fact is, that, excepting a short sketch of the manners prevailing in a particular district of the island, published in the Philosophical Transactions of the year 1778, not one page of information respecting the inhabitants of Sumatra has been communicated to the public by any Englishman who has resided there.

To form a general and tolerably accurate account of this country and its inhabitants, is a work attended with great and peculiar difficulties. The necessary information is not to be procured from the people themselves, whose knowledge and inquiries are to the last degree confined, scarcely extending beyond the bounds of the district where they first drew breath; and but very rarely have the almost impervious woods of Sumatra

---

* At the period when this remark was written, I was not aware that an account of the Dutch settlements and commerce in Sumatra, by M. Adolph Eschels-kroon, had in the preceding year been published at Hamburgh, in the German language; nor had the transactions of a literary society, established at Batavia, whose first volume appeared there in 1779, yet reached this country. The work, indeed, of Valentyn, containing a general history of the European possessions in the East Indies, should have exempted a nation to which oriental learning is largely indebted, from what I now consider as an unmerited reflection.
PREFACE.

Sumatra been penetrated, to any considerable distance from the sea coast, by Europeans, whose observations have been then imperfect; trusted perhaps to memory only; or if committed to paper, lost to the world by their deaths. Other difficulties arise from the extraordinary diversity of national distinctions, which, under a great variety of independent governments, divide this island in many directions; and yet not from their number merely, nor from the dissimilarity in their languages or manners, does the embarrassment entirely proceed: the local divisions are perplexed and uncertain; the extent of jurisdiction of the various princes is inaccurately defined; settlers from different countries, and at different periods, have introduced an irregular, though powerful influence, that supersedes in some places the authority of the established governments, and imposes a real dominion on the natives, where a nominal one is not assumed. This, in a course of years, is productive of innovations that destroy the originality and genuineness of their customs and manners, obliterate ancient distinctions, and render confused the path of an investigator.

These objections, which seem to have hitherto proved unsurmountable with such as might have been inclined to attempt the history of Sumatra, would also have deterred me from an undertaking apparently so arduous, had I not reflected, that those circumstances in which consisted the principal difficulty, were in fact the least interesting to the public, and of the least utility in themselves. It is of but small importance to determine with precision, whether a few villages on this or that particular river belong to one petty chief or to another; whether such a nation is divided into a greater or lesser number of tribes; or which of two neighbouring powers originally did homage to the other for its title. History is only to be prized as it tends to improve our knowledge of mankind, to which such investigations contribute in a very small degree.
I have therefore attempted rather to give a comprehensive, than a circumstantial description of the divisions of the country into its various governments; aiming at a more particular detail, in what respects the customs, opinions, arts, and industry of the original inhabitants, in their most genuine state. The interests of the European powers who have established themselves on the island; the history of their settlements, and of the revolutions of their commerce, I have not considered as forming a part of my plan; but these subjects, as connected with the accounts of the native inhabitants, and the history of their governments, are occasionally introduced.

I was principally encouraged to this undertaking by the promises of assistance I received from some ingenious, and very highly esteemed friends, who resided with me in Sumatra. It has also been urged to me here in England, that as the subject is altogether new, it is a duty incumbent on me, to lay the information I am in possession of, however defective, before the public, who will not object to its being circumscribed, whilst its authenticity remains unimpeachable. This last quality is that which I can with the most confidence take upon me to vouch for. The greatest portion of what I have described, has fallen within the scope of my own immediate observation; the remainder is either matter of common notoriety to every person residing in the island, or received upon the concurring authority of gentlemen, whose situation in the East India Company’s service, long acquaintance with the natives, extensive knowledge of their language, ideas, and manners, and respectability of character, render them worthy of the most implicit faith that can be given to human testimony.

I have been the more scrupulously exact in this particular, because my view was not, ultimately, to write an entertaining book, to which the
the marvellous might be thought not a little to contribute, but sincerely and conscientiously to add the small portion in my power, to the general knowledge of the age; to throw some glimmering light on the path of the naturalist; and more especially to furnish those philosophers, whose labours have been directed to the investigation of the history of Man, with facts to serve as data in their reasonings, which are too often rendered nugatory, and not seldom ridiculous, by assuming as truths, the misconceptions, or wilful impositions of travellers. The study of their own species is doubtless the most interesting and important that can claim the attention of mankind; and this science, like all others, it is impossible to improve by abstract speculation, merely. A regular series of authenticated facts is what alone can enable us to rise towards a perfect knowledge in it. To have added one new and firm step in this arduous ascent, is a merit of which I should be proud to boast.

Of this third edition it is necessary to observe, that the former two having made their appearance so early as the years 1783 and 1784, it would long since have been prepared for the public eye, had not the duties of an official situation occupied for many years the whole of my attention. During that period, however, I received from my friends abroad various useful, and, to me at least, interesting communications, which have enabled me to correct some inaccuracies, to supply deficiencies, and to augment the general mass of information on the subject of an island still but imperfectly explored. To incorporate these new materials requiring that many liberties should be taken with the original contexture of the work, I became the less scrupulous of making further alterations, wherever I thought they could be introduced with advan-
PREFACE.

tage. The branch of natural history in particular I trust will be found to have received much improvement, and I feel happy to have had it in my power to illustrate several of the most interesting productions of the vegetable and animal kingdoms by engravings executed from time to time, as the drawings were procured, and which are intended to accompany the volume in a separate atlas.
Sumatran Alphabets.

Rejang:

The terminating sounds of these letters are varied by the application of the following Signs:

Duo de\attas changes
n Kazima.
\* Kazinga.
\* Ka-havan
\* Kazinda

which last, like the jezma of the Arabsians, serve to cut off or deaden the vocal utterance, as the term expresses. Of these Signs more than one may be applied to the same character, as \$ in, \$ bu, \$ na, \$ ang, \$ baun, \$ pur. \$ marks the Commencement of the writing, which proceeds horizontally, from the left hand to the right, the series of lines descending, most usually, from the top of the page; but not infrequently the bottom line is the first written, and the others in succession towards the top. This practice (common to other tribes) appears to have given rise to the idea (noticed at p. 363) that the Batta are accustomed to write perpendicularly "from the bottom to the top of the line."

Batta.

The Signs which govern the terminating sounds of these letters are: \(\), \+, \(\), \(\), \(\), \(\), \(\), \(\), \(\). The terminal \(\) ha takes the sound of k. With the exception of the first two letters, it does not appear that any determinate order is observed in the arrangement of the Alphabet, which is found to vary more or less in every specimen.

Lampong:

In these letters the Signs are applied in the following manner: \(\) ki, \(\) hango, \(\) or \(\) ku, \(\) kun, \(\) kar, \(\) ker or \(\), \(\) kon or \(\). \(\) ha, \(\) hau, \(\) lari, \(\) nat, as \(\) \(\) \(\) \(\) lampaht.
THE

HISTORY OF SUMATRA.

If antiquity holds up to us some models, in different arts and sciences, which have been found inimitable; the moderns, on the other hand, have carried their inventions and improvements, in a variety of instances, to an extent and a degree of perfection, of which the former could entertain no ideas. Among those discoveries in which we have stept so far beyond our masters, there is none more striking, or more eminently useful, than the means which the ingenuity of some, and the experience of others, have taught mankind, of determining with certainty and precision the relative situation of the various countries of the earth. What was formerly the subject of mere conjecture, or at best of vague and arbitrary computation, is now the clear result of settled rule, founded upon principles demonstratively just. It only remains for the liberality of princes and states, and the persevering industry of navigators and travellers, to effect the application of these means to their proper end, by continuing to ascertain the unknown and uncertain positions of all the parts of the world, which the barriers of nature will allow the skill and industry of man to approach.

B

SUMATRA,
SUMATRA.

Situation of the island. Sumatra, the subject of the present work, is an extensive island in the East Indies, the most western of those which may be termed the Malayan Archipelago, and constituting its boundary on that side. The equator divides it obliquely, its general direction being north-west and south-east, into almost equal parts; the one extremity lying in five degrees thirty-three minutes north, and the other, in five degrees fifty-six minutes south latitude. In respect to relative position, its northern point stretches into the bay of Bengal; its south-west coast is exposed to the great Indian ocean; towards the south it is separated by the straits of Sunda from the island of Java; on the east, by the commencement of the Eastern and China seas, from Borneo and other islands; and on the north-east, by the straits of Malacca, from the peninsula of Malaya, to which, according to a tradition noticed by the Portuguese historians, it is supposed to have been anciently united.

Longitude. The only point of the island whose longitude has been settled by actual observation, is Fort Marlborough, near Bencoolen, the principal English settlement, standing in three degrees forty-six minutes of south latitude. From eclipses of Jupiter’s satellites observed in June 1769, preparatory to an observation of the transit of the planet Venus over the sun’s disc, Mr. Robert Nairne calculated its longitude to be $101^\circ 42' 45''$; which was afterwards corrected by the Astronomer Royal to $102^\circ$ east of Greenwich. The situation of Achin Head is pretty accurately fixed by computation at $95^\circ 34'$; and longitudes of places in the straits of Sunda are well ascertained by the short runs from Batavia, which city has the advantage of an observatory. By the general use of chronometers in latter times, the means have been afforded of determining the positions of many prominent points both on the eastern and western coasts, by which the map of the island has been considerably improved: but particular surveys, such as those of the bays and islets from Batang-kapas to Padang, made with great ability by Captain (now Lt. Col.) John Macdonald; of the coast from Priaman to the islands off Achin by Capt. George Robertson; and of Siak River by Mr. Francis Lynch, are much wanted; and the interior of the country is still very imperfectly known. From sketches of the routes of Mr. Charles Campbell and of Lieut. Hastings Dare, I have been enabled to delineate the principal features of the Sarampei, Suigeléi, Tenang
SUMATRA.

Tenang and Korinchi countries, inland of Ipu, Moco-Moco, and Indrapura; and advantage has been taken of all other information that could be procured. For the general materials from which the map is constructed, I am chiefly indebted to the kindness of my friend, the late Mr. Alexander Dalrymple, whose indefatigable labours during a long life, have contributed more than those of any other person to the improvement of Indian Hydrography. It may be proper to observe, that the map of Sumatra, to be found in the fifth volume of Valentyn’s great work, is so extremely incorrect, even in regard to those parts immediately subject to the Dutch government, as to be quite useless.

Notwithstanding the obvious situation of this island, in the direct track from the ports of India to the spice islands and to China, it seems to have been unknown to the Greek and Roman geographers, whose information or conjectures carried them no farther than Selan-dib or Ceylon, which has claims to be considered as their Taprobane; although, during the middle ages, that celebrated name was almost uniformly applied to Sumatra. The single circumstance, indeed, of the latter being intersected by the equator (as Taprobane was said to be) is sufficient to justify the doubts of those who were disinclined to apply it to the former; and whether in fact the obscure and contradictory descriptions given by Strabo, Pomponius Mela, Pliny, and Ptolemy, belonged to any actual place, however imperfectly known; or whether, observing that a number of rare and valuable commodities were brought from an island or islands in the supposed extremity of the East, they might have been led to give place in their charts to one of vast extent, which should stand as the representative of the whole, is a question not to be hastily decided.

The idea of Sumatra being the country of Ophir, whither Solomon sent Ophir, his fleets for cargoes of gold and ivory, rather than to the coast of Sofala, or other part of Africa, is too vague, and the subject wrapt in a veil of too remote antiquity, to allow of satisfactory discussion; and I shall only observe, that no inference can be drawn from the name of Ophir found in maps, as belonging to a mountain in this island and to another in the peninsula; these having been applied to them by European navigators, and the word being unknown to the natives.

Until
SUMATRA.

Until the discovery of the passage to India by the Cape of Good Hope, the identity of this island as described or alluded to by writers, is often equivocal, or to be inferred only from corresponding circumstances.

The first of the two Arabian travellers of the ninth century, the account of whose voyages to India and China was translated by Renaudot from a manuscript written about the year 1173, speaks of a large island called Ramni, in the track between Sarandib and Sin (or China), that from the similarity of productions has been generally supposed to mean Sumatra; and this probability is strengthened by a circumstance I believe not hitherto noticed by commentators. It is said to divide the sea of Herkend, or Indian ocean, from the sea of Shelahet (Salahet in Edrisi), and Salát being the Malayan term both for a strait in general, and for the well-known passage within the island of Sinagapura in particular; this may be fairly presumed to refer to the straits of Malacca.

Edrisi, improperly called the Nubian geographer, who dedicated his work to Roger, king of Sicily, in the middle of the twelfth century, describes the same island, in the first climate, by the name of Al-Rami; but the particulars so nearly correspond with those given by the Arabian traveller, as to shew that the one account was borrowed from the other. He, very erroneously, however, makes the distance between Sarandib and that island to be no more than three days' sail, instead of fifteen. The island of Soborna, which he places in the same climate, is evidently Borneo, and the two passages leading to it, are the straits of Malacca and of Sunda. What is mentioned of Sumandar, in the second climate, has no relation whatever to Sumatra, although from the name we are led to expect it.

MARCO POLO, the celebrated Venetian traveller of the thirteenth century, is the first European who speaks of this island, but under the appellation of Java minor, which he gave to it by a sort of analogy, having forgotten, or not having learned from the natives, its appropriate name. His relation, though for a long time undervalued, and by many considered as a romantic tale, and liable as it is to the charge of errors and
and omissions, with some improbabilities, possesses, notwithstanding, strong internal evidence of genuineness and good faith. Containing few dates, the exact period of his visit to Sumatra cannot be ascertained, but as he returned to Venice in 1295, and possibly five years might have elapsed in his subsequent tedious voyages and journeys by Ceylon, the Karnatick, Malabar, Guzerat, Persia, the shores of the Caspian and Euxine, to Genoa (in a prison at which place he is said to have dictated his narrative), we may venture to refer it to the year 1290.

Taking his departure, with a considerable equipment, from a southern port of China, which he (or his transcriber) named Zaitum, they proceeded to Ziamba (Tsampa or Champa, adjoining to the southern part of Cochin-china) which he had previously visited in 1280, being then in the service of the emperor Kublai Khan. From thence, he says, to the island of Java major is a course of fifteen hundred miles, but it is evident that he speaks of it only from the information of others, and not as an eye-witness; nor is it probable that the expedition should have deviated so far from its proper route. He states truly that it is a mart for spices, and much frequented by traders from the southern provinces of China. He then mentions in succession the small uninhabited islands of Sondur and Condur (perhaps Pulo Condore); the province of Boéach otherwise Lochac (apparently Camboja, near to which Condore is situated); the island of Petan (either Patani or Pahang in the peninsula) the passage to which, from Boéach, is across a gulf (that of Siam); and the kingdom called Malaiur in the Italian, and Maletur in the Latin version, which we can scarcely doubt to be the Malayan kingdom of Singa-pura, at the extremity of the peninsula, or Malacca, then beginning to flourish. It is not, however, asserted that he touched at all these places, nor does he seem to speak from personal knowledge, until his arrival at Java minor (as he calls it) or Sumatra. This island, lying in a south-eastern direction from Petan (if he does not rather mean from Malaiur, the place last mentioned) he expressly says he visited, and describes it as being in circumference two thousand miles (not very wide of the truth in a matter so vague), extending to the southward so far as to render the polar star invisible, and divided into eight kingdoms, two of which he did not see,
and the six others he enumerates as follows: Ferlech, which I apprehend to be Parlak, at the eastern extremity of the northern coast, where they were likely to have first made the land. Here he says the people in general were idolaters; but the Saracen merchants who frequented the place had converted to the faith of Mahomet the inhabitants of the towns, whilst those of the mountains lived like beasts, and were in the practice of eating human flesh. Basma or Basman: this nearly approaches in sound to Pasaman on the western coast, but I should be more inclined to refer it to Pasê (by the Portuguese written Paçem) on the northern. The manners of the people here, as in the other kingdoms, are represented as savage; and such they might well appear to one who had long resided in China. Wild elephants are mentioned, and the rhinoceros is well described. Samara: this I suppose to be Samar-lanîga, likewise on the northern coast, and noted for its bay. Here, he says, the expedition, consisting of two thousand persons, was constrained to remain five months, waiting the change of the monsoon; and being apprehensive of injury from the barbarous natives, they secured themselves, by means of a deep ditch, on the land side, with its extremities embracing the port, and strengthened by bulwarks of timber. With provisions they were supplied in abundance, particularly the finest fish. There is no wheat, and the people live on rice. They are without vines, but extract an excellent liquor from trees of the palm kind, by cutting off a branch, and applying to it a vessel, which is filled in the course of a day and night. A description is then given of the Indian or coco-nut. Dragoian, a name bearing some, though not much resemblance to Indra-giri, on the eastern coast; but I doubt his having proceeded so far to the southward as that river. The customs of the natives are painted as still more atrocious in this district. When any of them are afflicted with disorders pronounced by their magicians to be incurable, their relations cause them to be suffocated, and then dress and eat their flesh; justifying the practice by this argument, that if it were suffered to corrupt and breed worms, these must presently perish, and by their deaths subject the soul of the deceased to great torments. They also kill and devour such strangers caught amongst them as cannot pay a ransom. Lambri might be presumed a corruption of Jambi, but the circumstances related do not justify the analogy. It is said to produce camphor, which is not found
SUMATRA.

to the southward of the equinoctial line; and also verzino, or red-wood, (though I suspect benzuin to be the word intended), together with a plant which he names birci, supposed to be the bakam of the Arabs, or sappan wood of the eastern islands, the seeds of which he carried with him to Venice. In the mountainous parts were men with tails a palm long; also the rhinoceros, and other wild animals. Lastly, Fanfur or Fansur, which corresponds better to Campar than to the island of Panchur, which some have supposed it. Here the finest camphor was produced, equal in value to its weight in gold. The inhabitants live on rice, and draw liquor from certain trees, in the manner before described. There are likewise trees that yield a species of meal. They are of a large size, have a thin bark, under which is a hard wood about three inches in thickness, and within this the pith, from which, by means of steeping and straining it, the meal (or sago) is procured, of which he had often eaten with satisfaction. Each of these kingdoms is said to have had its peculiar language. Departing from Lambri, and steering northward from Java minor, one hundred and fifty miles, they reached a small island named Necuram or Norcueran (probably Nancowry, one of the Nicobars), and afterwards an island named Angaman (Andaman), from whence steering to the southward of west a thousand miles, they arrived at that of Zeilan or Seilam, one of the most considerable in the world.—The editions consulted are chiefly the Italian of Ramusio, 1583, Latin of Müller, 1671, and French of Bergeron, 1735, varying much from each other in the orthography of proper names.

ODORICUS, a friar, who commenced his travels in 1318, and died at Padua in 1331, had visited many parts of the East. From the southern part of the coast of Coromandel he proceeded by a navigation of twenty days, to a country named Lamor (perhaps a corruption of the Arabian Al-rami), to the southward of which is another kingdom named Sumoltra, and not far from thence a large island named Java. His account, which was delivered orally to the person by whom it was written down, is extremely meagre and unsatisfactory.

MANDEVILLE, who travelled in the fourteenth century, seems to have
SUMATRA.

have adopted the account of Odoricus, when he says, “Beside the yse of Lemery is another that is clept Sumobor; and fast beside, a great yse clept Java.”

Nicolo di Conti, of Venice, returned from his oriental travels in 1449, and communicated to the secretary of Pope Eugenius IV. a much more consistent and satisfactory account of what he had seen, than any of his predecessors. After giving a description of the cinnamon and other productions of Zeilam, he says he sailed to a great island named Sumatra, called by the ancients Taprobane, where he was detained one year. His account of the pepper-plant, of the durian fruit, and of the extraordinary customs, now well ascertained, of the Batech or Batta people, prove him to have been an intelligent observer.

A small work entitled Itinerarium Portugallensium, printed at Milan in 1508, after speaking of the island of Sayla, says, that to the eastward of this there is another called Samotra, which we name Taprobane, distant from the city of Calechut about three months’ voyage. The information appears to have been obtained from an Indian of Cranganore, on the coast of Malabar, who visited Lisbon in 1501.

Ludovico Barthema.

Ludovico Barthema (Vartoma) of Bologna, began his travels in 1503, and in 1505, after visiting Malacca, which he describes as being the resort of a greater quantity of shipping than any other port in the world, passed over to Pedir in Sumatra, which he concludes to be Taprobane. The productions of the island, he says, were chiefly exported to Catai or China. From Sumatra he proceeded to Banda and the Moluccas, from thence returned by Java and Malacca to the west of India, and arrived at Lisbon in 1508.

Odoardus Barbosa.

Odoardus Barbosa, of Lisbon, who concluded the journal of his voyage in 1516, speaks with much precision of Sumatra. He enumerates many places, both upon the coast, and inland, by the names they now bear, among which he considers Pedir as the principal; distinguishes between the Mahometan inhabitants of the coast and the Pagans of the inland.
inland country; and mentions the extensive trade carried on by the former with Cambaia in the west of India.

In the account given by Antonio Pigafetta, the companion of Ferdinand de Magalhães, of the famous circumnavigatory voyage performed by the Spaniards in the years 1519—22, it is stated, that from their apprehension of falling in with Portuguese ships, they pursued their westerly route from the island of Timor, by the Laut Kidol, or southern ocean, leaving on their right hand the island of Zamatra (written in another part of the journal, Somatra) or Taprobana of the ancients. Mention is also made of a native of that island being on board, who served them usefully as an interpreter in many of the places they visited; and we are here furnished with the earliest specimen of the Malayan language.

Previously, however, to this Spanish navigation of the Indian seas, by the way of South America, the expeditions of the Portuguese round the Cape of Good Hope, had rendered the island well known, both in regard to its local circumstances and the manners of its inhabitants. In a letter from Emanuel king of Portugal to Pope Leo the tenth, dated in 1513, he speaks of the discovery of Zamatra by his subjects; and the writings of Joao de Barros, Castanheda, Osorius, and Maffæus, detail the operations of Diogo Lopez Sequeira at Pedir and Pasé in 1509, and those of the great Affonso d'Alboquerque at the same places, in 1511, immediately before his attack upon Malacca. De Barros also enumerates the names of twenty of the principal places of the island with considerable precision, and observes, that the peninsula or chersonesus had the epithet of "aurea" given to it on account of the abundance of gold carried thither from Monancabo and Barros, countries in the island of Camatra.

Having thus noticed what has been written by persons who actually visited this part of India at an early period, or published from their oral communication by cotemporaries, it will not be thought necessary to multiply authorities by quoting the works of subsequent commentators.
With respect to the name of Sumatra, we perceive that it was unknown both to the Arabian travellers and to Marco Polo, who indeed was not likely to acquire it from the savage natives with whom he had intercourse. The appellation of Java minor, which he gives to the island, seems to have been quite arbitrary, and not grounded upon any authority, European or Oriental, unless we can suppose that he had determined it to be the ῥαβδίου ῥήσος of Ptolemy; but from the other parts of his relation it does not appear that he was acquainted with the work of that great geographer, nor could he have used it with any practical advantage. At all events it could not have led him to the distinction of a greater and a lesser Java; and we may rather conclude, that having visited (or heard of) the great island properly so called, and not being able to learn the real name of another, which from its situation and size might well be regarded as a sister island, he applied the same to both, with the relative epithets of major and minor. That Ptolemy's ἧβα-δίβ or dio was intended, however vaguely, for the island of Java, cannot be doubted. It must have been known to the Arabian merchants, and he was indefatigable in his inquiries; but at the same time that they communicated the name, they might be ill qualified to describe its geographical position.

In the rude narrative of Odoricus we perceive the first approach to the modern name in the word Sumoltra. Those who immediately followed him write it with a slight, and often inconsistent, variation in the orthography, Sumotra, Samotra, Zamatra, and Sumatra. But none of these travellers inform us from whom they learned it; whether from the natives or from persons who had been in the habits of frequenting it from the continent of India; which latter I think the more probable. Reland, an able oriental scholar, who directed his attention to the languages of the islands, says it obtains its appellation from a certain high land called Samadra, which he supposes to signify in the language of the country, a "large ant," but in fact there is not any spot so named; and although there is some resemblance between semul, the word for an ant,
ant, and the name in question, the etymology is quite fanciful. Others have imagined that they find an easy derivation in the word *samatra*, to be met with in some Spanish or Portuguese dictionaries, as signifying a sudden storm of wind and rain, and from whence our seamen may have borrowed the expression; but it is evident that the order of derivation is here reversed, and that the phrase is taken from the name of the land in the neighbourhood of which such squalls prevail. In a Persian work of the year 1611, the name of *Shamatrah* occurs as one of those places where the Portuguese had established themselves; and in some very modern Malayan correspondence I find the word *Samantara* employed (along with another more usual, which will be hereafter mentioned) to designate this island. These, it is true, are not entirely free from the suspicion of having found their way to the Persians and Malays through the medium of European intercourse; but to a person who is conversant with the languages of the continent of India, it must be obvious that the name, however written, bears a strong resemblance to words in the Sanskrit language: nor should this appear extraordinary, when we consider (what is now fully admitted) that a large proportion of the Malayan is derived from that source, and that the names of many places in this and the neighbouring countries (such as *Indra-pura* and *Indra-giri* in Sumatra, *Sünga-pura* at the extremity of the peninsula, and *Sukapura* and the mountain of *Maha-meru* in Java) are indisputably of Hindu origin. It is not my intention, however, to assign a precise etymology; but in order to shew the general analogy to known Sanskrit terms, it may be allowed to instance *Samuder*, the ancient name of the capital of the Carnatik, afterwards called *Bider*; *Samudra-duta*, which occurs in the *Hetopadesa*, as signifying the ambassador of the sea; the compound formed of *su*, good, and *matra*, measure; and more especially the word *samantara*, which implying "a boundary," "intermediate," or "what lies between," might be thought to apply to the peculiarity of the situation of an island "intermediate" between two oceans and two straits.

When on a former occasion it was asserted (and with too much confidence) that "the name of *Sumatra* is unknown to the natives, who are ignorant of its being an island, and have no general name for it," the
expression ought to have been confined to those natives with whom I had an opportunity of conversing, in the southern part of the west-coast, where much genuineness of manners prevails, with little of the spirit of commercial enterprise or communication with other countries. But even in situations more favourable for acquiring knowledge, I believe it will be found that the inhabitants of very large islands, and especially if surrounded by smaller ones, are accustomed to consider their own-as terra firma, and to look to no other geographical distinction than that of the district or nation to which they belong. Accordingly we find that the more general names have commonly been given by foreigners, and as the Arabians chose to call this island Al-Rami or Lameri, so the Hindus appear to have named it Sumatra or Samantara.

Since that period, however, having become much better acquainted with Malayan literature, and perused the writings of various parts of the peninsula and islands where the language is spoken and cultivated, I am enabled to say that Sumatra is well known amongst the eastern people and the better-informed of the natives themselves, by the two names of Indalas and Pulo Percha, (or in the southern dialect, Pritcho). Of the meaning or analogies of the former, which seems to have been applied to it chiefly by the neighbouring people of Java, I have not any conjecture, and only observe its resemblance (doubtless accidental) to the Arabian denomination of Spain or Andalusia. In one passage I find the straits of Malacca termed the sea of Indalas, over which, we are gravely told, a bridge was thrown by Alexander the Great. The latter and more common name is from a Malayan word signifying "fragments" or "tatters," and the application is whimsically explained by the condition of the sails of the vessel in which the island was circumnavigated for the first time; but it may with more plausibility be supposed to allude to the broken or intersected land for which the eastern coast is so remarkable. It will indeed be seen in the map, that in the vicinity of what are called Rupat's Straits, there is a particular place of this description named $P_o$. Percha, or the Broken Islands. As to the appellation of $P_o$. Ber-api, or Volcano Island, which has also occurred, it is too indefinite for a proper name, in a region of the globe where...
where the phenomenon is by no means rare or peculiar, and should rather be considered as a descriptive epithet.

In respect to magnitude, it ranks amongst the largest islands in the world; but its breadth throughout is determined with so little accuracy, that any attempt to calculate its superficies must be liable to very considerable error. Like Great Britain, it is broadest at the southern extremity, narrowing gradually to the north; and to this island it is perhaps in size more nearly allied than in shape.

A chain of mountains runs through its whole extent, the ranges being in many parts double and treble, but situated, in general, much nearer to the western than the opposite coast; being, on the former, seldom so much as twenty miles from the sea, whilst on the eastern side the extent of level country, in the broader part of the island, through which run the great rivers of Siak, Indra-giri, Jambi, and Palembang, cannot be less than an hundred and fifty. The height of these mountains, though very great, is not sufficient to occasion their being covered with snow, during any part of the year, as those in South America, between the tropics, are found to be. Mount Ophir, or gunong Pasaman, situated immediately under the equinoctial line, is supposed to be the highest visible from the sea; its summit being elevated thirteen thousand eight hundred and forty-two feet above that level; which is no more than two-thirds of the altitude the French astronomers have ascribed to the loftiest of the Andes, but somewhat exceeds that of the Peak of Teneriffe.\footnote{The following is the result of observations made by Mr. Robert Nairne, of the height of Mount Ophir.}

these ridges of mountains, are extensive plains, considerably elevated above the surface of the maritime lands, where the air is cool; and from this advantage they are esteemed the most eligible portion of the country, are consequently the best inhabited, and the most cleared from woods, which elsewhere in general throughout Sumatra, cover both hills and vallies with an eternal shade. Here too are found many large and beautiful lakes that extend, at intervals, through the heart of the country, and facilitate much the communication between the different parts; but their dimensions, situation, or direction, are very little known, though the natives make frequent mention of them in the accounts of their journeys. Those principally spoken of are, one of great extent, but unascertained situation, in the Battai country; one in the Korinchi country, lately visited by Mr. C. Campbel; and another in the Lampong country, extending towards Pasumah, navigated by boats of a large class, with sails, and requires a day and night to effect the passage across it; which may be the case in the rainy season, as that part of the island, through which the Tulang Bawang river flows, is subject to extensive inundations, causing it to communicate with the river of the Palembang. In a journey made many years since by a son of the Sultan of the latter place, to visit the English resident at Croee, he is said to have proceeded by the way of that lake. It is much to be regretted, that the situation of so important a feature in the geography of the island should be at this day the subject of uncertain conjecture.

Waterfalls and cascades are not uncommon, as may be supposed, in a country of so uneven a surface as that of the western coast. A remarkable

Inland, nearly 29 Naut. miles.

In order to form a comparison, I subjoin the height, as computed by mathematicians, of other mountains in different parts of the world.

Chimborazo, the highest of the Andes, 3290 toises, or 20,633 English feet. Of this about 2400 feet from the summit are covered with eternal snow.
S U M A T R A.

remarkable one descends from the north-side of Mount Pugong. The island of Mansalar lying off, and affording shelter to the bay of Tappanuli, presents to the view a fall of very striking appearance, the reservoir of which the natives assert (in their fondness for the marvellous) to be a huge shell of the species called Kima (chama gigas), found in great quantities in that bay, as well as at New Guinea and other parts of the east. At the bottom of this fall ships occasionally take in their water, without being under the necessity of landing their casks; but such attempts are liable to extreme hazard. A ship from England (the Elgin) attracted by the appearance from sea of a small but beautiful cascade descending perpendicularly from the steep cliff, that, like an immense rampart, lines the sea-shore near Manna, sent a boat in order to procure fresh water; but she was lost in the surf, and the crew drowned.

No country in the world is better supplied with water than the western coast of the island. Springs are found wherever they are sought for, and the rivers are innumerable; but they are in general too small and rapid for the purpose of navigation. The vicinity of the mountains to that side of the island occasions this profusion of rivulets, and at the same time the imperfections that attend them, by not allowing them space to accumulate to any considerable size. On the eastern coast, the distance of the range of hills not only affords a larger scope for the course of the rivers before they disembogue, presents a greater surface for the receptacle of rain and vapours, and enables them to unite a greater number of subsidiary streams, but also renders the flux more steady and uniform by the extent of level space, than where the torrent rolls more immediately from the mountains. But it is not to be understood that on the western side there are no large rivers. Kataun, Indrapura, Tabuyong,

*The largest I have seen was brought from Tappanuli by Mr. James Moore, of Arno's Vale, in the north of Ireland. It is 3ft. 3\(\frac{1}{2}\)inch. in its longest diameter, and 2ft. 1\(\frac{1}{2}\)inch. across. One of the methods of taking them, in deep water, is by thrusting a long bamboo between the valves as they lie open, when by the immediate closure which follows, they are made fast. The substance of the shell is perfectly white, several inches thick, is worked by the natives into arm-rings, and in the hands of our artists is found to take a polish equal to the finest statuary marble.
Sumatra.

Tabuyong, and Sinkel, have a claim to that title, although inferior in size to Palembang, Jambi, Indragiri, and Siak. The latter derive also a material advantage from the shelter given to them by the peninsula of Malacca, and Borneo, Banca, and the other islands of the Archipelago, which, breaking the force of the sea, prevent the surf from forming those bars that choke the entrance of the south-western rivers, and render them impracticable to boats of any considerable draught of water. These labour too under this additional inconvenience, that scarcely any, except the largest, run out to sea in a direct course. The continual action of the surf, more powerful than the ordinary force of the stream, throws up at their mouths a bank of sand, which, in many instances, has the effect of diverting their course to a direction parallel with the shore, between the cliffs and the beach, until the accumulated waters at length force their way wherever there is found the weakest resistance. In the southerly Monsoon, when the surfs are usually highest, and the streams, from the dryness of the weather, least rapid, this parallel course is of the greatest extent; and Moco-moco river takes a course, at times, of two or three miles, in this manner, before it mixes with the sea; but as the rivers swell with the rain, they gradually remove obstructions and recover their natural channel.

The heat of the air is by no means so intense as might be expected, in a country occupying the middle of the torrid zone. It is more temperate than in many regions without the tropics, the thermometer, at the most sultry hour, which is about two in the afternoon, generally fluctuating between 82 and 85 degrees. I do not recollect to have ever seen it higher than 86 in the shade, at Fort Marlborough; although at Natal, in lat. 34° N. it is not unfrequently at 87° and 88°. At sun-rise it is usually as low as 70; the sensation of cold, however, is much greater than this would seem to indicate, as it occasions shivering and a chattering of the teeth; doubtless from the greater relaxation of the body and openness of the pores in that climate; for the same temperature in England would be esteemed a considerable degree of warmth. These observations on the state of the air apply only to the districts near the sea-coast, where, from their comparatively low situation, and the greater compression of the atmosphere, the sun’s rays operate more powerfully.

Inland,
Inland, as the country ascends, the degree of heat decreases rapidly, insomuch, that beyond the first range of hills, the inhabitants find it expedient to light fires in the morning, and continue them till the day is advanced, for the purpose of warming themselves; a practice unknown in the other parts of the island; and in the journal of Lieut. Dare's expedition it appears, that during one night's halt on the summit of a mountain, in the rainy season, he lost several of his party from the severity of the weather, whilst the thermometer was not lower than 40°. To the cold also they attribute the backwardness in growth of the coconut tree, which is sometimes twenty or thirty years in coming to perfection, and often fails to produce fruit. Situations are uniformly colder in proportion to their height above the level of the sea, unless where local circumstances, such as the neighbourhood of sandy plains, contribute to produce a contrary effect; but in Sumatra the coolness of the air is promoted by the quality of the soil, which is clayey, and the constant and strong verdure that prevails, which, by absorbing the sun's rays, prevents the effect of their reflection. The circumstance of the island being so narrow contributes also to its general temperateness, as wind directly or recently from the sea is seldom possessed of any violent degree of heat, usually acquired in passing over large tracts of land in the tropical climates. Frost, snow, and hail, I believe to be unknown to the inhabitants. The hill-people in the country of Lampong speak, indeed, of a peculiar kind of rain that falls there, which some have supposed to be what we call sleet; but the fact is not sufficiently established. The atmosphere is in common more cloudy than in Europe, which is sensibly perceived, from the infrequency of clear star-light nights. This may proceed from the greater rarefaction of the air occasioning the clouds to descend lower and become more opaque, or merely from the stronger heat exhaling from the land and sea a thicker and more plentiful vapour. The fog, called Kabūt by the natives, which is observed to rise every morning among the distant hills, is dense to a surprising degree; the extremities of it, even when near at hand, being perfectly defined; and it seldom is observed to disperse till about three hours after sun-rise.

That extraordinary phænomenon, the waterspout, so well known to Waterspout.

D and
and described by navigators, frequently makes its appearance in these parts, and occasionally on shore. I had seen many at sea; but the largest and most distinct (from its proximity) that I had an opportunity of observing, presented itself to me whilst on horseback. I was so near to it, that I could perceive what appeared to be an inward gyration, distinct from the volume surrounding it or body of the tube; but am aware that this might have been a deception of sight, and that it was the exterior part which actually revolved—as quiescent bodies seem to persons in quick motion, to recede in a contrary direction. Like other waterspouts, it was sometimes perpendicular and sometimes curved, like the pipe of a still-head; its course tending in a direction from Bengoolen Bay across the peninsula on which the English settlement stands; but before it reached the sea on the other side, it diminished by degrees, as if from want of the supplies that should be furnished by its proper element, and collected itself into the cloud from which it depended, without any consequent fall of water or destructive effect. The whole operation we may presume to be of the nature of a whirlwind, and the violent ebullition in that part of the sea to which the lower extremity of the tube points, to be a corresponding effect to the agitation of the leaves or sand on shore, which in some instances are raised to a vast height; but in the formation of the waterspout the rotatory motion of the wind acts not only upon the surface of the land or sea, but also upon the overhanging cloud, and seems to draw it downwards.

Thunder and lightning are there so very frequent, as scarcely to attract the attention of persons long resident in the country. During the north-west monsoon, the explosions are extremely violent; the forked lightning shoots in all directions, and the whole sky seems on fire; whilst the ground is agitated in a degree, little inferior to the motion of a slight earthquake. In the south-east monsoon, the lightning is more constant, but the coruscations are less fierce or bright, and the thunder is scarcely audible. It would seem that the consequences of these awful meteors are not so fatal there as in Europe; few instances occurring of lives being lost, or buildings destroyed by the explosions, although electrical conductors have never been employed. Perhaps the paucity of inhabitants, in proportion to the extent of country, and the unsubstantial materials
SUMATRA.

materials of the houses, may contribute to this observation. I have seen some trees, however, that have been shattered in Sumatra by the action of lightning.a

The causes which produce a successive variety of seasons in the parts of the earth without the tropics, having no relation or respect to the region of the torrid zone, a different order takes place there, and the year is distinguished into two divisions, usually called the rainy and dry monsoons or seasons, from the weather peculiar to each. In the several parts of India these monsoons are governed by various particular laws, in regard to the time of their commencement, period of duration, circumstances attending their change, and direction of the prevailing wind according to the nature and situation of the lands and coasts where their influence is felt. The farther peninsula of India, where the kingdom of Siam lies, experiences at the same time the effects of opposite seasons; the western side, in the bay of Bengal, being exposed for half the year to continual rains, whilst on the eastern side the finest weather is enjoyed; and so on the different coasts of Indostan, the monsoons exert their influence alternately; the one remaining serene and undisturbed, whilst the other is agitated by storms. Along the coast of Coromandel, the change, or breaking up of the monsoon, as it is called, is frequently attended with the most violent gales of wind.

On the west coast of Sumatra, southward of the equinoctial, the SE. monsoon, or dry season, begins about May, and slackens in September: the NW. monsoon begins about November, and the hard rains cease about March. The monsoons for the most part commence and leave off gradually there; the months of April and May, October and November, generally affording weather and winds variable and uncertain.

The causes of these periodical winds have been investigated by several able

---

a Since the above was written, accounts have been received that a magazine, at Fort Marlborough, containing four hundred barrels of powder, was fired by lightning, and blown up, on the 18th of March, 1782.
able naturalists, whose systems, however, do not entirely correspond either in the principles laid down, or in their application to the effects known to be produced in different parts of the globe. I shall summarily mention what appear to me the most evident, or probable at least, among the general laws, or inferences, which have been deduced from the examination of this subject. If the sea were perfectly uninterrupted, and free from the irregular influence of lands, a perpetual easterly wind would prevail in all that space comprehended between the twenty-eighth or thirtieth degrees of north and south latitude. This is primarily occasioned by the diurnal revolution of the earth upon its axis from west to east; but whether through the operation of the sun, proceeding westward, upon the atmospheric fluid, or the rapidity of revolution of the solid body, which leaves behind it that fluid with which it is surrounded, and thereby causes it virtually to recede in a contrary direction; or whether these principles co-operate, or unequally oppose each other, as has been ingeniously contended, I shall not take upon me to decide. It is sufficient to say, that such an effect appears to be the first general law of the tropical winds. Whatever may be the degree of the sun's influence upon the atmosphere, in his transient diurnal course, it cannot be doubted but that in regard to his station in the path of the ecliptic, his power is considerable. Towards that region of the air which is rarefied by the more immediate presence of the heat, the colder and denser parts will naturally flow. Consequently from about, and a few degrees beyond, the tropics, on either side, the air tends towards the equator; and combining with the general eastern current before-mentioned, produces (or would, if the surface were uniform) a NE. wind in the northern division, and a SE. in the southern; varying in the extent of its course, as the sun happens to be more or less remote at the time. These are denominated the trade-winds, and are the subject of the second general observation. It is evident that with respect to the middle space between the tropics, those parts which at one season of the year lie to the northward of the sun, are, during another, to the southward of him; and of course, that an alteration of the effects last described must take place, according to the relative situation of the luminary; or, in other words, that the principle which causes at one time a NE. wind to prevail at any particular spot in those latitudes, must, when the circumstances are changed,
changed, occasion a SE. wind. Such may be esteemed the outline of the periodical winds, which undoubtedly depend upon the alternate course of the sun, northwards and southwards; and this I state as the third general law. But although this may be conformable with experience in extensive oceans, yet in the vicinity of continents, and great islands, deviations are remarked that almost seem to overturn the principle. Along the western coast of Africa, and in some parts of the Indian seas, the periodical winds, or monsoons, as they are termed in the latter, blow from the WNW. and SW. according to the situation, extent, and nature of the nearest lands; the effect of which upon the incumbent atmosphere, when heated by the sun, at those seasons in which he is vertical, is prodigious, and possibly superior to that of any other cause which contributes to the production or direction of wind. To trace the operation of this irregular principle through the several winds prevalent in India, and their periodical failures and changes, would prove an intricate, but I conceive by no means an impossible task. It is foreign, however, to my present purpose, and I shall only observe, that the NE. monsoon is changed, on the western coast of Sumatra, to NW. or WNW. by the influence of the land. During the SE. monsoon, the wind is found to blow there, between that point and south. Whilst the sun continues near the equator, the winds are variable, nor is their direction fixed till he has advanced several degrees towards the tropic: and this is the cause of the monsoons usually setting in, as I have observed, about May and November, instead of the equinoctial months.

Thus much is sufficient with regard to the periodical winds. I shall proceed to give an account of those distinguished by the appellation of land and sea breezes, which require from me a minuter investigation, both because, as being more local, they more especially belong to my subject, and that their nature has hitherto been less particularly treated of by naturalists.
In this island, as well as all other countries between the tropics, of any considerable extent, the wind uniformly blows from the sea to the land, for a certain number of hours in the four and twenty, and then changes, and blows for about as many from the land to the sea; excepting only when the monsoon rages with remarkable violence, and even at such time the wind rarely fails to incline a few points, in compliance with the efforts of the subordinate cause, which has not power, under these circumstances, to produce an entire change. On the west coast of Sumatra, the sea-breeze usually sets in, after an hour or two of calm, about ten in the forenoon, and continues till near six in the evening. About seven the land-breeze comes off, and prevails through the night till towards eight in the morning, when it gradually dies away.

These depend upon the same general principle that causes and regulates all other wind. Heat acting upon air, rarefies it, by which it becomes specifically lighter, and mounts upward. The denser parts of the atmosphere, which surround that so rarefied, rush into the vacuity from their superior weight; endeavouring, as the laws of gravity require, to restore the equilibrium. Thus in the round buildings where the manufactory of glass is carried on, the heat of the furnace in the centre being intense, a violent current of air may be perceived to force its way in, through doors or crevices, on opposite sides of the house. As the general winds are caused by the direct influence of the sun's rays upon the atmosphere, that particular deviation of the current distinguished by the name of land and sea breezes, is caused by the influence of his reflected rays, returned from the earth or sea on which they strike. The surface of the earth is more suddenly heated by the rays of the sun, than that of the sea, from its greater density and state of rest; consequently it reflects those rays sooner and with more power: but owing also to its density, the heat is more superficial than that imbibed by the sea, which becomes more intimately warmed, by its transparency, and by its motion, continually presenting a fresh surface to the sun. I shall now endeavour to apply these principles. By the time the rising sun has ascended to the height of thirty or forty degrees above the horizon, the earth has acquired, and reflected on the body of air situated over
over it, a degree of heat sufficient to rarefy it and destroy its equilibrium; in consequence of which, the body of air above the sea, not being equally, or scarcely at all raresied, rushes towards the land; and the same causes operating so long as the sun continues above the horizon, a constant sea-breeze, or current of air from sea to land, prevails during that time. From about an hour before sun-set, the surface of the earth begins to lose the heat it has acquired from the more perpendicular rays. That influence of course ceases, and a calm succeeds. The warmth imparted to the sea, not so violent as that of the land, but more deeply imbibed, and consequently more permanent, now acts in turn, and by the rarefaction it causes, draws towards its region the land air, grown cooler, more dense, and heavier, which continues thus to flow back, till the earth, by a renovation of its heat in the morning, once more obtains the ascendancy. Such is the general rule, conformable with experience, and founded, as it seems to me, in the laws of motion, and the nature of things. The following observations will serve to corroborate what I have advanced, and to throw additional light on the subject, for the information and guidance of any future investigator.

The periodical winds which are supposed to blow during six months from the NW. and as many from the SE. rarely observe this regularity, except in the very heart of the monsoon; inclining, almost at all times, several points to seaward, and not unfrequently blowing from the SW. or in a line perpendicular to the coast. This must be attributed to the influence of that principle which causes the land and sea winds proving on these occasions more powerful than the principle of the periodical winds; which two seem here to act at right angles with each other; and as the influence of either is prevalent, the winds draw towards a course perpendicular to, or parallel with the line of the coast. Excepting when a squall, or other sudden alteration of weather, to which these climates are particularly liable, produces an irregularity, the tendency of the land-wind at night has almost ever a correspondence with the sea-wind of the preceding or following day; not blowing in a direction immediately opposite to it (which would be the case, if the former were, as some writers have supposed, merely the effect of the accumu-
lution and redundancy of the latter, without any positive cause), but forming an equal and contiguous angle, of which the coast is the common side. Thus, if the coast be conceived to run N. and S., the same influence, or combination of influences, which produces a sea-wind at NW. produces a land-wind at NE.; or adapting the case to Sumatra, which lies NW. and SE., a sea-wind at S. is preceded or followed by a land-wind at E. This remark must not be taken in too strict a sense, but only as the result of general observation. If the land-wind, in the course of the night, should draw round from E. to N. it would be looked upon as an infallible prognostic of a W. or NW. wind the next day. On this principle it is that the natives foretel the direction of the wind by the noise of the surf at night, which if heard from the northward, is esteemed the forerunner of a northerly wind, and vice versa. The quarter from which the noise is heard depends upon the course of the land-wind, which brings the sound with it, and drowns it to leeward—the land-wind has a correspondence with the next day's sea-wind—and thus the divination is accounted for.

The effect of the sea-wind is not perceived to the distance of more than three or four leagues from the shore in common, and for the most part it is fainter in proportion to the distance. When it first sets in, it does not commence at the remoter extremity of its limits, but very near the shore, and gradually extends itself farther to sea, as the day advances; probably taking the longer or shorter course as the day is more or less hot. I have frequently observed the sails of ships, at the distance of four, six, or eight miles, quite becalmed, whilst a fresh sea-breeze was at the time blowing upon the shore. In an hour afterwards they have felt its effect.*

Passing along the beach about six o'clock in the evening, when the sea-breeze is making its final efforts, I have perceived it to blow with a considerable

* This observation, as well as many others I have made on the subject, I find corroborated in the Treatise before quoted from the Haerlem Transactions, which I had not seen when the present work was first published.
SUMATRA.

considerable degree of warmth, owing to the heat the sea had by that
time acquired, which would soon begin to divert the current of air to-
wards it, when it had first overcome the vis inertiae that preserves motion
in a body after the impelling power has ceased to operate. I have like-
wise been sensible of a degree of warmth on passing, within two hours
after sun-set, to leeward of a lake of fresh water; which proves the as-
sertion of water imbining a more permanent heat than earth. In the
day-time the breeze would be rendered cool in crossing the same lake.

Approaching an island situated at a distance from any other land, I
was struck with the appearance of the clouds about nine in the morning,
which then formed a perfect circle round it, the middle being a clear
azure, and resembled what the painters call a glory. This I account
for from the reflected rays of the sun rarefying the atmosphere imme-
diately over the island, and equally in all parts, which caused a conflux
of the neighbouring air, and with it the circumjacent clouds. These last,
tending uniformly to the centre, compressed each other at a certain dis-
tance from it, and, like the stones in an arch of masonry, prevented each
other's nearer approach. That island, however, does not experience the
vicissitude of land and sea breezes, being too small, and too lofty, and
situated in a latitude where the trade or perpetual winds prevail in their
utmost force. In sandy countries the effect of the sun's rays penetrat-
deeply, a more permanent heat is produced, the consequence of which
should be, the longer continuance of the sea-breeze in the evening; and
agreeably to this supposition I have been informed, that on the coast of
Coromandel it seldom dies away before ten at night. I shall only add on
this subject, that the land-wind on Sumatra is cold, chilly, and damp;
an exposure to it is therefore dangerous to the health, and sleeping in it
almost certain death.

The soil of the western side of Sumatra may be spoken of generally as soil,
a stiff, reddish clay, covered with a stratum or layer of black mould, of
no considerable depth. From this there springs a strong and perpetual
verdure, of rank grass, brush wood, or timber trees, according as the
country has remained a longer or shorter time undisturbed by the conse-
quences of population, which being in most places extremely thin, it

follows
follows that a great proportion of the island, and especially to the southward, is an impervious forest.

Along the western coast of the island, the low country, or space of land which extends from the sea-shore to the foot of the mountains, is intersected and rendered uneven to a surprising degree by swamps, whose irregular and winding course may in some places be traced in a continual chain for many miles, till they discharge themselves either into the sea, some neighbouring lake, or the fens that are so commonly found near the banks of the larger rivers, and receive their overflowings in the rainy monsoons. The spots of land which these swamps encompass become so many islands and peninsulas, sometimes flat at top, and often mere ridges; having in some places a gentle declivity, and in others descending almost perpendicularly to the depth of an hundred feet. In few parts of the country of Bencoolen, or of the northern districts adjacent to it, could a tolerably level space of four hundred yards square be marked out. I have often, from an elevated situation, where a wider range was subjected to the eye, surveyed with admiration the uncommon face which nature assumes, and made inquiries and attended to conjectures on the causes of these inequalities. Some choose to attribute them to the successive concussions of earthquakes, through a course of centuries. But they do not seem to be the effect of such a cause. There are no abrupt fissures; the hollows and swellings are for the most part smooth and regularly sloping, so as to exhibit not unfrequently the appearance of an amphitheatre, and they are clothed with verdure from the summit to the edge of the swamp. From this latter circumstance it is also evident that they are not, as others suppose, occasioned by the falls of heavy rains that deluge the country for one half of the year; which is likewise to be inferred from many of them having no apparent outlet, and commencing where no torrent could be conceived to operate. The most summary way of accounting for this extraordinary unevenness of surface were to conclude, that in the original construction of our globe, Sumatra was thus formed by the same hand which spread out the sandy plains of Arabia, and raised up the Alps and Andes beyond the region of the clouds. But this is a mode of solution, which, if generally adopted, would become an insuperable bar to all progress in natural knowledge, by
SUMATRA.

by damping curiosity and restraining research. Nature, we know from sufficient experience, is not only turned from her original course by the industry of man, but also sometimes checks and crosses her own career. What has happened in some instances, it is not unfair to suppose may happen in others; nor is it presumption to trace the intermediate causes of events, which are themselves derived from one first, universal, and eternal principle. To me it would seem, that the springs of water with which these parts of the island abound in an uncommon degree, operate directly, though obscurely, to the producing this irregularity of the surface of the earth. They derive their number, and an extraordinary portion of activity, from the loftiness of the ranges of mountains that occupy the interior country, and intercept and collect the floating vapours. Precipitated into rain at such a height, the water acquires in its descent through the fissures or pores of these mountains, a considerable force, which exerts itself in every direction, lateral and perpendicular, to procure a vent. The existence of these copious springs is proved, in the facility with which wells are every where sunk; requiring no choice of ground, but as it may respect the convenience of the proprietor; all situations, whether high or low, being prodigal of this valuable element. Where the approaches of the sea have rendered the cliffs abrupt, innumerable rills, or rather a continued moisture is seen to ooze through, and trickle down the steep. Where, on the contrary, the sea has retired and thrown up banks of sand in its retreat, I have remarked the streams of water, at a certain level, and commonly between the boundaries of the tide, effecting their passage through the loose and feeble barrier opposed to them. In short, every part of the low country is pregnant with springs that labour for the birth; and these continual struggles, this violent activity of subterraneous waters, must gradually undermine the plains above. The earth is imperceptibly excavated, the surface settles in, and hence the inequalities we speak of. The operation is slow, but unremitting, and, I conceive, fully capable of the effect.

The earth of Sumatra is rich in minerals and other fossil productions. No country has been more famous in all ages for gold, and though the sources from whence it is drawn may be supposed in some measure exhausted, by the avarice and industry of ages, yet at this day the quantity

Salt petre. The but was scarcely near chief but Sulphur is gathered in large quantities about the numerous volcanos. Salt petre the natives procure, by a process of their own, from the earth which is found impregnated with it; chiefly in extensive caves that have been, from the beginning of time, the haunt of certain species of birds, of whose dung the soil is formed. Coal, mostly washed down by the floods, is collected in several parts, particularly at Kattaun, Ayer-ram-mi, and Bencoolen. It is light, and not esteemed very good; but I am informed that this is the case with all coal found near the surface of the earth, and as the veins are observed to run in an inclined direction, until the pits have some depth, the fossil must be of an indifferent quality.

The little island of Pisang, near the foot of Mount Pugong, was supposed to be chiefly a bed of rock crystal, but upon examination of specimens taken from thence, they proved to be calcareous spar. Mineral and hot springs have been discovered in many districts. In taste the waters mostly resemble those of Harrowgate, being nauseous to the palate. The oleum terra, or earth oil, used chiefly as a preservative against the destructive ravages of the white ants, is collected at Ipu and elsewhere. There is scarcely any species of hard rock to be met with in the low parts of the island, near the sea-shore. Besides the ledges of coral, which are covered by the tide, that which generally prevails is the napal, as it is called by the inhabitants, forming the basis of the red cliffs, and not unfrequently the beds of the rivers. Though this napal has the appearance of rock, it possesses in fact so little solidity, that it is difficult to pronounce whether it be a soft stone or only an indurated clay. The surface of it becomes smooth and glossy by a slight attrition, and to the touch resembles soap, which is its most striking characteristic; but it is not soluble in water, and makes no effervescence with acids. Its colour is either grey, brown, or red, according to the nature of the earth that prevails in its composition. The red napal has by much the smallest proportion of sand, and seems to possess all the qualities of the steatite

\[\text{The fountain of Naphtha or liquid balsam, found at Pedir, so much celebrated by the Portuguese writers, is doubtless this oleum terra, or meniak tanah, as it is called by the Malays.}\]

steatite or soap earth, found in Cornwall and other countries. The specimens of stone which I brought from the hills in the neighbourhood of Bencoolen, were pronounced, by some mineralogists to whom I shewed them at the time, to be Granite; but upon more particular examination they appear to be a species of Trap, consisting principally of Feldtspar and Hornblend, of a greyish colour, and nearly similar to the mountain stone of North Wales.

Where the encroachments of the sea have undermined the land, the cliffs are left abrupt and naked, in some places to a very considerable height. In these many curious fossils are discovered, such as petrified wood, and sea-shells of various sorts. Hypotheses on this subject have been so ably supported and so powerfully attacked, that I shall not presume to intrude myself in the lists. I shall only observe, that being so near the sea, many would hesitate to allow such discoveries to be of any weight in proving a violent alteration to have taken place in the surface of the terraquous globe; whilst, on the other hand, it is unaccountable how, in the common course of natural events, such extraneous matter should come to be lodged in strata, at the height, perhaps, of fifty feet above the level of the water, and as many below the surface of the land. Here are likewise found various species of earths, which might be applied to valuable purposes, as painters' colours, and otherwise. The most common are the yellow and red, probably ochres, and the white, which answers the description of the milenum of the ancients.

There are a number of volcano mountains in this, as in almost all the other islands of the eastern Archipelago. They are called in the Malay language gunong-api, or, more correctly, gunong ber-api. Lava has been seen to flow from a considerable one near Priamang; but I have never heard of its causing any other damage than the burning of woods. This, however, may be owing to the thinness of population, which does not render it necessary for the inhabitants to settle in a situation that exposes them to danger of this kind. The only volcano I had an opportunity of observing, opened in the side of a mountain, about twenty miles inland of Bencoolen, one-fourth way from its top, as nearly as I can judge. It scarcely ever failed to emit smoke; but the column was only visible
visible for two or three hours in the morning, seldom rising and preserving its form, above the upper edge of the hill, which is not of a conical shape, but extending with a gradual slope. The high trees with which the country thereabout is covered, prevent the crater from being discernible at a distance; and this proves, that the spot is not considerably raised or otherwise affected by the eruptions. I could never perceive that it had any connection with the earthquakes, which are very frequently felt there. Sometimes it has emitted smoke upon these occasions, and in other instances, not. Yet, during a smart earthquake which happened a few years before my arrival, it was remarked to send forth flame, which it is rarely known to do. The apprehension of the European inhabitants, however, is rather more excited, when it continues any length of time without a tendency to an eruption, as they conceive it to be the vent by which the inflammable matter escapes, that would otherwise produce these commotions of the earth. Comparatively with the descriptions I have read of earthquakes in South America, Calabria, and other countries, those which happen in Sumatra, are generally very slight; and the usual manner of building, renders them but little formidable to the natives. The most severe that I have known, was chiefly experienced in the district of Manna, in the year 1770. A village was destroyed by the houses falling down and taking fire, and several lives were lost. The ground was in one place rent a quarter of a mile, the width of two fathoms, and depth of four or five. A bituminous matter is described to have swelled over the sides of the cavity, and the earth, for a long time after the shocks, was observed to contract and dilate alternately. Many parts of the hills far inland could be distinguished to have given way, and a consequence of this was, that during three weeks, Manna River was so much impregnated with particles of clay, that the natives could not bathe in it. At this time was

---

a Some gentlemen, who deny the fact of its having at any time emitted flame, conjecture, that what exhibits the appearance of smoke, is more probably vapour, arising from a considerable hot spring. The natives speak of it as a volcano.

b I am informed that in 1763, an entire village was swallowed up by an earthquake in Poolo Nias, one of the islands which lie off the western coast of Sumatra. In July or August of the same year, a severe one was felt in Bengal.
was formed near to the mouth of Padang Guchi, a neighbouring river, south of the former, a large plain, seven miles long and half a mile broad; where there had been before only a narrow beach. The quantity of earth brought down on this occasion was so considerable, that the hill upon which the English resident’s house stands, appears, from indubitable marks, less elevated by fifteen feet than it was before the event. Earthquakes have been remarked by some to happen usually upon sudden changes of weather, and particularly after violent heats; but I do not vouch this upon my own experience, which has been pretty ample. They are preceded by a low rumbling noise like distant thunder. The domestic cattle and fowls are sensible of the preternatural motion, and seem much alarmed; the latter making the cry they are wont to do on the approach of birds of prey. Houses situated on a low sandy soil are least affected, and those which stand on distinct hills, suffer most from the shocks, because the further removed from the centre of motion, the greater the agitation; and the loose contexture of the one foundation, making less resistance than the solidity of the other, subjects the building to less violence. Ships at anchor in the road, though several miles distant from the shore, are strongly sensible of the concussion.

Besides the new land formed by the convulsions above described, the sea by a gradual recess in some parts, produces the same effect. Many instances of this kind, of no considerable extent, however, have been observed within the memory of persons now living. But it would seem to me, that that large tract of land, called Pulo Point, forming the bay of the name, near to Silebar, with much of the adjacent country, has thus been left by the withdrawing, or thrown up by the motion of the sea. Perhaps the point may have been at first an island (from whence its appellation of Pulo) and the parts more inland, gradually united to it.* Various circumstances tend to corroborate such an opinion, and to evince the probability that this was not an original portion of the main, but new, half-formed land. All the swamps and marshy grounds that lie

* Since I formed this conjecture, I have been told that such a tradition, of no very ancient date, prevails amongst the inhabitants.
lie within the beach, and near the extremity there are little else, are known, in consequence of repeated surveys, to be lower than the level of high water; the bank of sand alone preventing an inundation. The country is not only quite free from hills or inequalities of any kind, but has scarcely a visible slope. Silebar River, which empties itself into Pulo Bay, is totally unlike those in other parts of the island. The motion of its stream is hardly perceptible; it is never affected by floods; its course is marked out, not by banks covered with ancient and venerable woods, but by rows of mangroves and other aquatics, springing from the ooze, and perfectly regular. Some miles from the mouth, it opens into a beautiful and extensive lake, diversified with small islands, flat, and verdant with rushes only. The point of Pulo is covered with the Arau tree (casuarina) or bastard pine, as some have called it, which never grows but in the sea-sand, and rises fast. None such are found toward Sun'gei-lamo and the rest of the shore northward of Marlborough Point, where, on the contrary, you perceive the effects of continual depredations by the ocean. The old forest trees are there yearly undermined, and falling, obstruct the traveller; whilst about Pulo, the Arau trees are continually springing up, faster than they can be cut down or otherwise destroyed. Nature will not readily be forced from her course. The last time I visited that part, there was a beautiful rising grove of these trees, establishing a possession in their proper soil. The country, as well immediately hereabout, as to a considerable distance inland, is an entire bed of sand, without any mixture of clay or mould, which I know to have been in vain sought for, many miles up the neighbouring rivers. To the northward of Padang there is a plain, which has evidently been, in former times, a bay. Traces of a shelving beach are there distinguishable at the distance of one hundred and fifty yards from the present boundary of the sea.

But upon what hypothesis can it be accounted for, that the sea should commit depredations on the northern coast, of which there are the most evident tokens, as high up at least as Ipu, and probably to Indrapura, where the shelter of the neighbouring islands may put a stop to them, and that it should restore the land to the southward, in the manner I have described? I am aware that according to the general motion of the
the tides from east to west, this coast ought to receive a continual accession, proportioned to the loss which others, exposed to the direction of this motion, must and do sustain; and it is likely that it does gain upon the whole. But the nature of my work obliges me to be more attentive to effects than causes, and to record facts, though they should clash with systems the most just in theory, and most respectable in point of authority.

The chain of islands which lie parallel with the west coast of Sumatra, may probably have once formed a part of the main, and been separated from it, either by some violent effort of nature, or the gradual attrition of the sea. I should scarcely introduce the mention of this apparently vague surmise, but that a circumstance presents itself on the coast, which affords some stronger colour of proof than can be usually obtained in such instances. In many places, and particularly about Pally, we observe detached pieces of land standing singly, as islands, at the distance of one or two hundred yards from the shore, which were head-lands of points running out into the sea, within the remembrance of the inhabitants. The tops continue covered with trees or shrubs; but the sides are bare, abrupt, and perpendicular. The progress of insulation here is obvious and incontrovertible, and why may not larger islands, at a greater distance, have been formed, in the revolution of ages, by the same accidents? The probability is heightened by the direction of the islands, Nias, Batu, Mantawei, Pagi, Mego, &c. the similarity of rock, soil, and productions, and the regularity of soundings between them and the main, whilst without them the depth is unfathomable.

Where the shore is flat or shelving, the coast of Sumatra, as of all other tropical islands, is defended from the attacks of the sea by a reef or ledge of coral rock, on which the surfs exert their violence without further effect than that of keeping its surface even, and reducing to powder those beautiful excrescences and ramifications which have been so much the object of the naturalist’s curiosity, and which some ingenious men, who have analysed them, contend to be the work of insects. The coral powder is in particular places accumulated on the shore in great
great quantities, and appears, when not closely inspected, like a fine white sand.

The surf (a word not to be found, I believe, in our dictionaries) is used in India, and by navigators in general, to express a peculiar swell and breaking of the sea upon the shore; the phenomena of which not having been hitherto much adverted to by writers, I shall be the more circumstantial in my description of them.

The surf forms sometimes but a single range along the shore. At other times there is a succession of two, three, four, or more, behind each other, extending perhaps half a mile out to sea. The number of ranges is generally in proportion to the height and violence of the surf.

The surf begins to assume its form at some distance from the place where it breaks, gradually accumulating as it moves forward, till it gains a height, in common, of fifteen to twenty feet, when it overhangs at top, and falls, like a cascade, nearly perpendicular, involving itself as it descends. The noise made by the fall is prodigious, and, during the stillness of the night, may be heard many miles up the country.

Though in the rising and formation of the surf, the water seems to have a quick progressive motion towards the land, yet a light body on the surface is not carried forward, but, on the contrary, if the tide is ebbing, will recede from the shore; from which it would follow, that the motion is only propagated in the water, like sound in air, and not the mass of water protruded. A similar species of motion is observed on shaking at one end, a long cord held moderately slack, which is expressed by the word undulation. I have sometimes remarked, however, that a body which sinks deep, and takes hold of the water, appears to move towards shore

* It may be presumed that in this estimation of its height I was considerably deceived.
SHORE with the course of the surf, as is perceptible in a boat landing, which seems to shoot swiftly forward on the top of the swell; though probably it is only after having reached the summit, and may owe its velocity to its own weight in the descent.

Countries where the surfs prevail, require boats of a particular construction, and the art of managing them demands the experience of a man’s life. All European boats are more or less unfit, and seldom fail to occasion the sacrifice of the people on board them, in the imprudent attempts that are sometimes made to land with them on the open coast. The natives of Coromandel are remarkably expert in the management of their craft; but it is to be observed, that the intervals between the breaking of the surfs are usually on that coast much longer than on the coast of Sumatra.

The force of the surf is extremely great. I have known it to overshoot a country vessel in such a manner, that the top of the mast has stuck in the sand, and the lower end made its appearance through her bottom. Pieces of cloth have been taken up from a wreck, twisted and rent by its involved motion. In some places the surfs are usually greater at high, and in others at low, water; but I believe they are uniformly more violent during the spring-tides.

I shall proceed to inquire into the efficient cause of the surfs. The winds have doubtless a strong relation to them. If the air was in all places of equal density, and not liable to any motion, I suppose the water would also remain perfectly at rest, and its surface even; abstracting from the general course of the tides, and the partial irregularities occasioned by the influx of rivers. The current of the air impels the water, and causes a swell, which is the regular rising and subsiding of the waves. This rise and fall is similar to the vibrations of a pendulum, and subject to like laws. When a wave is at its height, it descends by the force of gravity, and the momentum acquired in descending, impels the neighbouring particles, which, in their turn, rise and impel others, and thus form a succession of waves. This is the case in the open sea; but when the swell approaches the shore, and the depth of water...
water is not in proportion to the size of the swell, the subsiding wave, instead of pressing on a body of water, which might rise in equal quantity, presses on the ground, whose re-action causes it to rush on in that manner, which we call a surf. Some think that the peculiar form of it may be plainly accounted for from the shallowness and shelving of the beach. When a swell draws near to such a beach, the lower parts of the water meeting first with obstruction from the bottom, stand still, whilst the higher parts respectively move onward, by which a rolling and involved motion is produced, that is augmented by the return of the preceding swell. I object, that this solution is founded on the supposition of an actual progressive motion of the body of water in forming a surf; and that certainly not being the fact, it seems deficient. The only real progression of the water is occasioned by the perpendicular fall, after the breaking of the surf, when, from its weight, it foams on to a greater or less distance, in proportion to the height from which it fell, and the slope of the shore.

That the surfs are not, like common waves, the immediate effect of the wind, is evident from this, that the highest and most violent often happen when there is the least wind, and vice versa. And sometimes the surfs will continue with an equal degree of violence during a variety of weather. On the west coast of Sumatra, the highest are experienced during the SE. monsoon, which is never attended with such gales of wind as the NW. The motion of the surf is not observed to follow the course of the wind, but often the contrary; and when it blows hard from the land, the spray of the sea may be seen to fly in a direction opposite to the body of it, though the wind has been for many hours in the same point.

Are the surfs the effect of gales of wind at sea, which do not happen to extend to the shore, but cause a violent agitation throughout a considerable tract of the waters, which motion communicating with less distant parts, and meeting at length with resistance from the shore, occasions the sea to swell and break in the manner described? To this I object, that there seems no regular correspondence between their magnitude, and the apparent agitation of the water without them: that gales of
of wind, except at particular periods, are very unfrequent in the Indian seas, where the navigation is well known to be remarkably safe, whilst the surfs are almost continual; and that gales are not found to produce this effect in other extensive oceans. The west coast of Ireland borders a sea nearly as extensive, and much more wild than the coast of Sumatra, and yet there, though when it blows hard the swell on the shore is high and dangerous, is there nothing that resembles the surfs of India.

These, so general in the tropical latitudes, are, upon the most probable hypothesis I have been able to form, after long observation, and much thought and inquiry, the consequence of the trade or perpetual winds which prevail, at a distance from shore, between the parallels of thirty degrees north and south, whose uniform and invariable action causes a long and constant swell, that exists even in the calmest weather, about the line, towards which its direction tends from either side. This swell or libration of the sea, is so prodigiously long, and the sensible effect of its height, of course, so much diminished, that it is not often attended to; the gradual slope engrossing almost the whole horizon, when the eye is not very much elevated above its surface: but persons who have sailed in those parts may recollect that even when the sea is apparently the most still and level, a boat or other object at a distance from the ship, will be hidden from the sight of one looking towards it from the lower deck, for the space of minutes together. This swell, when a squall happens, or the wind freshens up, will, for the time, have other subsidiary waves on the extent of its surface, breaking often in a direction contrary to it, and which will again subside as a calm returns, without having produced on it any perceptible effect. Sumatra, though not continually exposed to the south-east trade-wind, is not so distant but that its influence may be presumed to extend to it, and accordingly at Pulo Pisang, near the southern extremity of the island, a constant southerly sea is observed, even after a hard north-west wind. This incessant and powerful swell rolling in from an ocean, open even to the pole, seems an agent adequate to the prodigious effects produced on the coast; whilst its very size contributes to its being overlooked. It reconciles almost all the difficulties which the phænomena seem to present, and in particular it accounts for the decrease of the surf during the NW. monsoon,
soon, the local wind then counteracting the operation of the general one; and it is corroborated by an observation I have made, that the surfs on the Sumatran coast ever begin to break at their southern extreme, the motion of the swell not being perpendicular to the direction of the shore. This manner of explaining their origin seems to carry much reason with it; but there occurs to me one objection which I cannot get over, and which a regard to truth obliges me to state. The trade-winds are remarkably steady and uniform, and the swell generated by them is the same. The surfs are much the reverse, seldom persevering for two days in the same degree of violence; often mountains high in the morning, and nearly subsided by night. How comes an uniform cause to produce effects so unsteady, unless by the intervention of secondary causes, whose nature and operation we are unacquainted with?

It is clear to me that the surfs, as above described, are peculiar to those climates which lie within the remoter limits of the trade-winds, though in higher latitudes large swells and irregular breakings of the sea are to be met with after boisterous weather. Possibly the following causes may be judged to conspire, with that I have already specified, towards occasioning this distinction. The former region being exposed to the immediate influence of the two great luminaries, the water, from their direct impulse, is liable to more violent agitation than nearer the poles, where their power is felt only by indirect communication. The equatorial parts of the earth performing their diurnal revolution, with greater velocity than the rest, a larger circle being described in the same time, the waters thereabout, from the stronger centrifugal force, may be supposed to feel less restraint from the sluggish principle of matter; to have less gravity; and therefore to be more obedient to external impulses of every kind, whether from the winds or any other cause.

The spring-tides on the west coast of Sumatra are estimated to rise in general no more than four feet, owing to its open, unconfined situation, which prevents any accumulation of the tide, as is the case in narrow seas. It is always high water there when the moon is in the horizon, and consequently at six o’clock nearly, on the days of conjunction and opposition.
opposition throughout the year, in parts not far remote from the equator. This, according to Newton's theory, is about three hours later than the uninterrupted course of nature; owing to the obvious impediment the waters meet with in revolving from the eastward.

Owing to this uniformity it becomes an easy matter for the natives to ascertain the height of the tide at any hour that the moon is visible. Whilst she appears to ascend, the water falls, and vice versa; the lowest of the ebb happening when she is in her meridian. The vulgar rule for calculating the tides is rendered also to Europeans more simple and practical from the same cause. There only needs to add together the epact, number of the month, and day of the month; the sum of which, if under thirty, gives the moon's age—the excess, if over. Allow forty-eight minutes for each day, or which is the same, take four-fifths of the age, and it will give you the number of hours after six o'clock, at which high water happens. A readiness at this calculation is particularly useful in a country where the sea-beach is the general road for travelling.
Having exhibited a general view of the island, as it is in the hands of nature, I shall now proceed to a description of the people who inhabit and cultivate it, and shall endeavour to distinguish the several species or classes of them, in such a manner as may best tend to perspicuity, and to furnish clear ideas of the matter.

The most obvious division, and which has been usually made by the writers of voyages, is that of Mahometan inhabitants of the sea coast, and Pagans of the inland country. This division, though not without its degree of propriety, is vague and imperfect; not only because each description of people differ considerably among themselves, but that the inland inhabitants are, in some places, Mahometans, and those of the coast, in others, what they term Pagans. It is not unusual with persons who have not resided in this part of the East, to call the inhabitants of the islands indiscriminately by the name of Malays. This is a more considerable error, and productive of greater confusion than the former. By attempting to reduce things to heads too general, we defeat the very end we propose to ourselves in defining them at all: we create obscurity where we wish to throw light. On the other hand, to attempt enumerating and distinguishing the variety, almost endless, of petty sovereignties and nations, into which this island is divided, many of which differ nothing in person or manners from their neighbours, would be a task both insurmountable and useless. I shall aim at steering a middle course, and accordingly shall treat of the inhabitants of Sumatra under the following summary distinctions, taking occasion as it may offer to mention the principal subdivisions. And first, it is proper to distinguish the empire of
of Menangkabau and the Malays; in the next place the Achinese; then the Battas; the Rejangs; and next to them the people of Lampong.*

Menangkabau being the principal sovereignty of the island, which formerly comprehended the whole, and still receives a shadow of homage from the most powerful of the other kingdoms, which have sprung up from its ruins, would seem to claim a right to precedence in description, but I have a sufficient reason for deferring it to a subsequent part of the work; which is, that the people of this empire, by their conversion to Mahometanism, and consequent change of manners, have lost in a greater degree than some neighbouring tribes, the genuine Sumatran character, which is the immediate object of my investigation. They are distinguished from the other inhabitants of this island by the appellation of Orang Malayo, or Malays, which, however, they have in common with those of the coast of the Peninsula, and of many other islands; and the name is applied to every Mussulman speaking the Malayan as his proper language, and either belonging to, or claiming descent from, the ancient kingdom of Menangkabau; wherever the place of his residence may be. Beyond Bencoolen to the southward there are none to be met with,

* In the course of my inquiries amongst the natives, concerning the aborigines of the island, I have been informed of two different species of people dispersed in the woods, and avoiding all communication with the other inhabitants. These they call Orang Kubu, and Orang Gugu. The former are said to be pretty numerous, especially in that part of the country which lies between Palembang and Jambi. Some have at times been caught and kept as slaves in Labun; and a man of that place is now married to a tolerably handsome Kubu girl, who was carried off by a party that discovered their huts. They have a language quite peculiar to themselves, and they eat promiscuously whatever the woods afford, as deer, elephant, rhinoceros, wild hog, snakes, or monkeys. The Gugu are much scarcer than these, differing in little but the use of speech, from the Orang Utan of Borneo; their bodies being covered with long hair. There have not been above two or three instances of their being met with by the people of Labun (from whom my information is derived), and one of these was entrapped many years ago, in much the same manner as the carpenter in Pilpay's Fables caught the monkey. He had children by a Labun woman, which also were more hairy than the common race; but the third generation are not to be distinguished from others. The reader will bestow what measure of faith he thinks due to this relation, the veracity of which I do not pretend to vouch for. It has probably some foundation in truth, but is exaggerated in the circumstances.
with, excepting such as have been drawn thither by, and are in the pay of, Europeans. On the eastern side of the island they are settled at the entrance of almost all the navigable rivers, where they more conveniently indulge their habitual bent for trade and piracy. It must be observed, indeed, that in common speech the term Malay, like that of Moor in the continent of India, is almost synonymous with Mahometan; and when the natives of other parts learn to read the Arabic character, submit to circumcision, and practise the ceremonies of religion, they are often said men-jâdi Malâyo, “to become Malays,” instead of the more correct expression sudah mâsuk îslâm, “have embraced the faith.” The distinction will appear more strongly from this circumstance, that whilst the sultan of Anak Suâi'ei (Moco-moco), ambitious of imitating the sultan of Menangkabau, styles himself and his immediate subjects Malays, his neighbour, the Panigeran of Suâi'ei Lâmo, chief of the Rejangs, a very civilized Mahometan, and whose ancestors for some generations were of the same faith, seemed offended, in a conversation I had with him, at my supposing him (as he is usually considered) a Malay, and replied, with some emotion, “Malayo tidah, sir; őrang ǚlũ betul sûyo. No Malay, sir; I am a genuine, aboriginal countryman.” The two languages he wrote and talked (I know not if he be still living) with equal facility; but the Rejang he esteemed his mother tongue.

Attempts to ascertain from what quarter Sumatra was peopled, must rest upon mere conjecture. The adjacent peninsula (called by Europeans or other foreigners the Malayan Peninsula) presents the most obvious source of population; and it has accordingly been presumed that emigrants from thence supplied it and the other islands of the eastern Archipelago with inhabitants. By this opinion, adopted without examination, I was likewise misled, and, on a former occasion, spoke of the probability of a colony from the peninsula having settled upon the western coast of the island; but I have since learned from the histories and traditions of the natives of both countries, that the reverse is the fact, and that the founders of the celebrated kingdoms of Johor, Siâgâpurâ, and Malacca, were adventurers from Sumatra. Even at this day the inhabitants of the interior parts of the peninsula are a race entirely distinct from those of the two coasts.

Thus
SUMATRA.

Thus much it was necessary, in order to avoid ambiguity, to say in the first instance concerning the Malays, of whom a more particular account will be given in a subsequent part of the work.

As the most dissimilar among the other classes into which I have divided the inhabitants, must of course have very many points of mutual resemblance, and many of their habits, customs, and ceremonies, in common, it becomes expedient, in order to avoid a troublesome and useless repetition, to single out one class from among them, whose manners shall undergo a particular and full investigation, and serve as a standard for the whole; the deviation from which, in other classes, shall afterwards be pointed out, and the most singular and striking usages peculiar to each, superadded. Various circumstances induce me, on this occasion, to give the preference to the Rejangs, though a nation of but small account in the political scale of the island. They are placed in what may be esteemed a central situation, not geographically, but with respect to the encroachments of foreign manners and opinions, introduced by the Malays, from the north, and Javans from the south; which gives them a claim to originality, superior to that of most others. They are a people whose form of government and whose laws extend, with very little variation, over a considerable part of the island, and principally that portion where the connexions of the English lie. There are traditions of their having formerly sent forth colonies to the southward; and in the country of Passumnah, the site of their villages is still pointed out; which would prove that they have formerly been of more consideration than they can boast at present. They have a proper language, and a perfect written character. These advantages point out the Rejang people as an eligible standard of description; and a motive equally strong that induces me to adopt them as such, is, that my situation and connexions in the island, led me to a more intimate and minute acquaintance with their laws and manners, than with those of any other class. I must premise, however, that the Malay customs having made their way, in a greater or less degree, to every part of Sumatra, it will be totally impossible to discriminate with entire accuracy, those which are original, from those which are borrowed: and of course, what I shall say of the Rejangs, will apply for the most part, not only to the Sumatrans in general.
SUMATRA.

The country of the Rejangs is divided, to the north-west, from the kingdom of Anak Sungei (of which Moco-moco is the capital) by the small river of Uri, near that of Kattaun; which last, with the district of Labun on its banks, bounds it on the north or inland side. The country of Musi, where Palembang River takes its rise, forms its limit to the eastward. Bencoolen River, precisely speaking, confines it on the south-east; though the inhabitants of the district called Lemba, extending from thence to Silebar, are entirely the same people, in manners and language. The principal rivers, besides those already mentioned, are Laye, Pally, and Sungailamo; on all of which the English have factories, the resident or chief being stationed at Laye.

The persons of the inhabitants of the island, though differing considerably in districts remote from each other, may in general be comprehended in the following description; excepting the Achinese, whose commixture with the Moors of the west of India, has distinguished them from the other Sumatrans.

They are rather below the middle stature; their bulk is in proportion; their limbs are for the most part slight, but well shaped, and particularly small at the wrists and ankles. Upon the whole they are gracefully formed, and I scarcely recollect to have ever seen one deformed person among the natives.* The women, however, have the preposterous custom of flattening the noses, and compressing the heads of children newly born, whilst the skull is yet cartilaginous, which increases their natural tendency to that shape. I could never trace the origin of the practice, or learn any other reason for moulding the features to this uncouth appearance,

* Ghirardini, an Italian painter, who touched at Sumatra on his way to China in 1698, observes of the Malays,

Son di persona tanto ben formata
Quanto mai finger sa pittori industri.

He speaks in high terms of the country, as being beautifully picturesque.
Sumatra.

pearance, but that it was an improvement of beauty in their estimation. Captain Cook takes notice of a similar operation at the island of Ulietea. They likewise pull out the ears of infants, to make them stand at an angle from the head. Their eyes are uniformly dark and clear, and among some, especially the southern women, bear a strong resemblance to those of the Chinese, in the peculiarity of formation so generally observed of that people. Their hair is strong, and of a shining black; the improvement of both which qualities it probably owes, in great measure, to the early and constant use of coco-nut oil, with which they keep it moist. The men frequently cut their hair short, not appearing to take any pride in it; the women encourage theirs to a considerable length, and I have known many instances of its reaching the ground. The men are beardless, and have chins so remarkably smooth, that were it not for the priests displaying a little tuft, we should be apt to conclude that nature had refused them this token of manhood. It is the same in respect to other parts of the body, with both sexes; and this particular attention to their persons, they esteem a point of delicacy, and the contrary an unpardonable neglect. The boys, as they approach to the age of puberty, rub their chins, upper lips, and those parts of the body that are subject to superfluous hair, with chunam, (quick line) especially of shells, which destroys the roots of the incipient beard. The few pilæ that afterwards appear, are plucked out from time to time with tweezers, which they always carry about them for that purpose. Were it not for the numerous and very respectable authorities, from which we are assured that the natives of America are naturally beardless, I should think that the common opinion on that subject had been rashly adopted, and that their appearing thus at a mature age, was only the consequence of an early practice, similar to that observed among the Sumatrans. Even now I must confess that it would remove some small degree of doubt from my mind, could it be ascertained, that no such custom prevails. a

Their

a It is allowed by travellers, that the Patagonians have tufts of hair on the upper lip and chin. Captain Carver says, that among the tribes he visited, the people made a regular practice of eradicating their beards with pincers. At Brussels is preserved, along with a variety of ancient and curious suits of armour, that of Montezuma, king of Mexico, of which
Their complexion is properly yellow; wanting the red tinge that constitutes a tawny or copper colour. They are in general lighter than the Mestees, or half breed, of the rest of India; those of the superior class, who are not exposed to the rays of the sun, and particularly their women of rank, approaching to a great degree of fairness. Did beauty consist in this one quality, some of them would surpass our brunettes in Europe. The major part of the females are ugly, and many of them even to disgust, yet there are those among them, whose appearance is strikingly beautiful; whatever composition of person, features, and complexion, that sentiment may be the result of.

The fairness of the Sumatrans, comparatively with other Indians, situated as they are, under a perpendicular sun, where no season of the year affords an alternative of cold, is, I think, an irrefragable proof, that the difference of colour in the various inhabitants of the earth, is not the immediate effect of climate. The children of Europeans born in this island are as fair as those born in the country of their parents. I have observed the same of the second generation, where a mixture with the people of the country has been avoided. On the other hand, the offspring and all the descendants of the Guinea and other African slaves imported there, continue in the last instance as perfectly black as in the original stock. I do not mean to enter into the merits of the question which naturally connects with these observations; but shall only remark, that the sallow and adust countenances, so commonly acquired by Europeans who have long resided in hot climates, are more ascribable to the effect of bilious distempers, which almost all are subject to in a greater or less degree, than of their exposure to the influence of the weather, which few but seafaring people are liable to, and of which the impression is seldom permanent. From this circumstance I have been led to conjecture that the general disparity of complexions in different nations, the visor, or mask for the face, has remarkably large whiskers; an ornament which those Americans could not have imitated, unless nature had presented them with the model.—See a paper in the Phil. Trans. for 1786, which puts this matter beyond a doubt. In a French dictionary of the Huron language, published in 1632, I observe a term corresponding to "arracher la barbe."
nations, might possibly be owing to the more or less copious secretion, or redundancy of that juice, rendering the skin more or less dark according to the qualities of the bile prevailing in the constitutions of each. But I fear such an hypothesis would not stand the test of experiment, as it might be expected to follow, that upon dissection, the contents of a negro’s gall-bladder, or at least the extravasated bile, should uniformly be found black. Persons skilled in anatomy will determine whether it is possible that the qualities of any animal secretion can so far affect the frame, as to render their consequences liable to be transmitted to posterity in their full force.  

The small size of the inhabitants, and especially of the women, may be in some measure owing to the early communication between the sexes; though, as the inclinations which lead to this intercourse are prompted here by nature sooner than in cold climates, it is not unfair to suppose, that being proportioned to the period of maturity, this is also sooner attained, and consequently that the earlier cessation of growth of these people, is agreeable to the laws of their constitution, and not occasioned by a premature and irregular appetite.

Persons of superior rank encourage the growth of their hand-nails, particularly those of the fore and little fingers, to an extraordinary length; frequently tinging them red, with the expressed juice of a shrub, which they call inei, the henna of the Arabians; as they do the nails of their feet also, to which, being always uncovered, they pay as much attention as to their hands. The hands of the natives, and even of the half breed, are always cold to the touch; which I cannot account for otherwise than by a supposition, that from the less degree of elasticity in the solids, occasioned by the heat of the climate, the internal action of the body, by which the fluids are put in motion, is less vigorous, the circulation is proportionably languid, and of course the diminished effect

---

3 In an "Essay on the Causes of the Variety of Complexion and Figure in the Human Species," published at Philadelphia in 1787, the permanent effect of the bilious secretion, in determining the colour, is strongly insisted upon.
effect is most perceptible in the extremities, and a coldness there is the natural consequence.

The natives of the hills, through the whole extent of the island, are subject to those monstrous wens from the throat, which have been observed of the Vallaisans, and the inhabitants of other mountainous districts in Europe. It has been usual to attribute this affection to the badness, thawed state, mineral quality, or other peculiarity of the waters; many skilful men having applied themselves to the investigation of the subject. My experience enables me to pronounce without hesitation, that the disorder, for such it is, though it appears here to mark a distinct race of people (orang-gūnong), is immediately connected with the hilliness of the country, and of course, if the circumstances of the water they use contribute thereto, it must be only so far as the nature of the water is affected by the inequality or height of the land. But in Sumatra neither snow nor other congelation is ever produced, which militates against the most plausible conjecture that has been adopted concerning the Alpine goitres. From every research that I have been enabled to make, I think I have reason to conclude, that the complaint is owing; among the Sumatrans, to the fogginess of the air in the vallies between the high mountains, where, and not on the summits, the natives of these parts reside. I before remarked, that between the ranges of hills, the kabut or dense mist was visible for several hours every morning; rising in a thick, opaque, and well-defined body, with the sun, and seldom quite dispersed till afternoon. This phænomenon, as well as that of the wens, being peculiar to the regions of the hills, affords a presumption that they may be connected; exclusive of the natural probability that a cold vapour, gross to an uncommon degree, and continually enveloping the habitations, should affect with tumours the throats of the inhabitants. I cannot pretend to say how far this solution may apply to the case of the goitres, but I recollect it to have been mentioned, that the only method of curing the people, is by removing them from the vallies to the clear and pure air on the tops of the hills; which seems to indicate a similar source of the distemper to what I have pointed out. The Sumatrans do not appear to attempt any remedy for it, the wens being consistent with the highest health in other respects.
The personal difference between the Malays of the coast, and the country inhabitants, is not so strongly marked but that it requires some experience to distinguish them. The latter, however, possess an evident superiority in point of size and strength, and are fairer complexioned, which they probably owe to their situation, where the atmosphere is colder; and it is generally observed, that people living near the seashore, and especially when accustomed to navigation, are darker than their inland neighbours. Some attribute the disparity in constitutional vigour, to the more frequent use of opium among the Malays, which is supposed to debilitate the frame; but I have noted that the Limun and Batang Asei gold traders, who are a colony of that race settled in the heart of the island, and who cannot exist a day without opium, are remarkably hale and stout; which I have known to be observed with a degree of envy by the opium-smokers of our settlements. The inhabitants of Pasumma, also, are described as being more robust in their persons, than the planters of the low country.

The original clothing of the Sumatrans is the same with that found by navigators among the inhabitants of the South Sea islands, and now generally called by the name of Otaheitean cloth. It is still used among the Rejangs for their working dress, and I have one in my possession, procured from these people, consisting of a jacket, short drawers, and a cap for the head. This is the inner bark of a certain species of tree, beaten out to the degree of fineness required; approaching the more to perfection, as it resembles the softer kind of leather, some being nearly equal to the most delicate kid-skin; in which character it somewhat differs from the South Sea cloth, as that bears a resemblance rather to paper, or to the manufacture of the loom. The country people now conform in a great measure to the dress of the Malays, which I shall therefore describe in this place, observing that much more simplicity still prevails among the former, who look upon the others as coxcombs, who lay out all their substance on their backs, whilst, in their turns, they are regarded by the Malays with contempt, as unpolished rustics.
A man's dress consists of the following parts. A close waistcoat, without sleeves, but having a neck like a shirt, buttoned close up to the top, with buttons, often of gold filagree. This is peculiar to the Malays. Over this they wear the baju, which resembles a morning gown, open at the neck, but generally fastened close at the wrists and half way up the arm, with nine buttons to each sleeve. The sleeves, however, are often wide and loose, and others again, though nearly tight, reach not far beyond the elbow; especially of those worn by the younger females, which, as well as those of the young men, are open in front no farther down than the bosom, and reach no lower than the waist, whereas the others hang loose to the knees, and sometimes to the ankles. They are made usually of blue or white cotton cloth; for the better sort, of chintz; and for great men, of flowered silks. The kāin sarong is not unlike a Scots highlander's plaid in appearance, being a piece of party-coloured cloth about six or eight feet long, and three or four wide, sewed together at the ends; forming, as some writers have described it, a wide sack without a bottom. This is sometimes gathered up, and slung over the shoulder like a sash, or else folded and tucked about the waist and hips; and in full dress it is bound on by the belt of the kris (dagger), which is of crimson silk, and wraps several times round the body, with a loop at the end, in which the sheath of the kris hangs. They wear short drawers, reaching half way down the thigh, generally of red or yellow taffeta. There is no covering to their legs or feet. Round their heads they fasten, in a particular manner, a fine, coloured handkerchief, so as to resemble a small turban; the country people usually twisting a piece of white or blue cloth for this purpose. The crown of their head remains uncovered, except on journeys, when they wear a tūdong or umbrella-hat, which completely screens them from the weather.

The women have a kind of bodice, or short waistcoat rather, that defends the breasts, and reaches to the hips. The kāin sarong, before described, comes up as high as the armpits, and extends to the feet, being kept on simply by folding and tucking it over, at the breast, except when the tali-pending, or zone, is worn about the waist, which forms an
an additional and necessary security. This is usually of embroidered cloth, and sometimes a plate of gold or silver, about two inches broad, fastening in the front with a large clasp of filagreement or chased work, with some kind of precious stone, or imitation of such, in the centre. The baju, or upper gown, differs little from that of the men, buttoning in the same manner at the wrists. A piece of fine, thin, cotton cloth, or slight silk, about five feet long, and worked or fringed at each end, called a salendang, is thrown across the back of the neck, and hangs down before; serving also the purpose of a veil to the women of rank when they walk abroad. The handkerchief is carried, either folded small in the hand, or in a long fold, over the shoulder. There are two modes of dressing the hair, one termed kündei, and the other sañggo. The first resembles much the fashion in which we see the Chinese women represented in paintings, and which I conclude they borrowed from thence, where the hair is wound circularly over the centre of the head, and fastened with a silver bodkin or pin. In the other mode, which is more general, they give the hair a single twist as it hangs behind, and then doubling it up, they pass it crosswise, under a few hairs separated from the rest, on the back of the head, for that purpose. A comb, often of tortoise-shell, and sometimes filagreement, helps to prevent it from falling down. The hair of the front, and of all parts of the head, is of the same length, and when loose, hangs together behind, with most of the women, in very great quantity. It is kept moist with oil, newly expressed from the coco-nut; but those persons who can afford it make use also of an empyreumatic oil extracted from gum benzoin, as a grateful perfume. They wear no covering, except ornaments of flowers, which, on particular occasions, are the work of much labour and ingenuity. The head-dresses of the dancing girls by profession, who are usually Javans, are very artificially wrought, and as high as any modern English lady's cap, yielding only to the feathered plumes of the year 1777. It is impossible to describe in words these intricate and fanciful matters, so as to convey a just idea of them. The flowers worn in undress are, for the most part, strung in wreaths, and have a very neat and pretty effect, without any degree of gaudiness, being usually white or pale yellow, small, and frequently only half-blown. Those generally chosen for these occasions, are the buñga-tanjong and buñga-mellur; the buñga-chumpaka is used to give
the hair a fragrance, but is concealed from the sight. They sometimes combine a variety of flowers in such a manner as to appear like one, and fix them on a single stalk; but these, being more formal, are less elegant, than the wreaths.

Among the country people, particularly in the southern countries, the virgins (anak gaddis, or goddesses, as it is usually pronounced) are distinguished by a fillet which goes across the front of the hair, and fastens behind. This is commonly a thin plate of silver, about half an inch broad: those of the first rank have it of gold, and those of the lowest class have their fillet of the leaf of the nipah tree. Beside this peculiar ornament, their state is denoted by their having rings or bracelets of silver or gold on their wrists. Strings of coins round the neck are universally worn by children, and the females, before they are of an age to be clothed, have, what may not be inaptly termed, a modesty-piece, being a plate of silver in the shape of a heart (called chaping) hung before, by a chain of the same metal, passing round the waist. The young women in the country villages manufacture themselves the cloth that forms the body-dress, or kain-sarong, which, for common occasions, is their only covering, and reaches from the breast no lower than the knees. The dresses of the women of the Malay bazars, on the contrary, extend as low as the feet; but here, as in other instances, the more scrupulous attention to appearances does not accompany the superior degree of real modesty. This cloth, for the wear both of men and women, is imported from the island of Celebes, or, as it is here termed, the Buggis country.

Both sexes have the extraordinary custom of filing and otherwise disfiguring their teeth, which are naturally very white and beautiful from the simplicity of their food. For files, they make use of small whetstones of different degrees of fineness, and the patients lie on their back during the operation. Many, particularly the women of the Lampong country, have their teeth rubbed down quite even with the gums; others have them formed in points; and some file off no more than the outer coat and extremities, in order that they may the better receive and retain the jetty blackness, with which they almost universally adorn them. The
black used on these occasions is the empyreumatic oil of the coconut shell. When this is not applied, the filing does not, by destroying what we term the enamel, diminish the whiteness of the teeth; but the use of betel renders them black, if pains be not taken to prevent it. The great men sometimes set theirs in gold, by casing, with a plate of that metal, the under row; and this ornament, contrasted with the black dye, has, by lamp or candle light, a very splendid effect. It is sometimes indented to the shape of the teeth, but more usually quite plain. They do not remove it either to eat or sleep.

At the age of about eight or nine, they bore the ears and file the teeth of the female children; which are ceremonies that must necessarily precede their marriage. The former they call betende, and the latter bedabong; and these operations are regarded in the family, as the occasion of a festival. They do not here, as in some of the adjacent islands, (of Nias in particular) increase the aperture of the ear to a monstrous size, so as in many instances to be large enough to admit the hand, the lower parts being stretched till they touch the shoulders. Their earrings are mostly of gold filagree, and fastened, not with a clasp, but in the manner of a rivet or nut screwed to the inner part.
I SHALL now attempt a description of the villages and buildings of the Sumatrans, and proceed to their domestic habits of economy, and those simple arts, on which the procuring of their food and other necessaries depends. These are not among the least interesting objects of philosophical speculation. In proportion as the arts in use with any people are connected with the primary demands of nature, they carry the greater likelihood of originality, because those demands must have been administered to, from a period coeval with the existence of the people themselves. Or if complete originality be regarded as a visionary idea, engendered from ignorance and the obscurity of remote events, such arts must be allowed to have the fairest claim to antiquity at least. Arts of accommodation, and more especially of luxury, are commonly the effect of imitation, and suggested by the improvements of other nations, which have made greater advances towards civilisation. These afford less striking and characteristic features, in delineating the picture of mankind, and though they may add to the beauty, diminish from the genuineness of the piece. We must not look for unequivocal generic marks, where the breed, in order to mend it, has been crossed by a foreign mixture. All the arts of primary necessity are comprehended within two distinctions: those which protect us from the inclemency of the weather and other outward accidents; and those which are employed in securing the means of subsistence. Both are immediately essential to the continuance of life, and man is involuntarily and immediately prompted to exercise them, by the urgent calls of nature, even in the merest possible state of savage and uncultivated existence. In climates like that of Sumatra, this impulse extends not far. The human machine is kept going with small effort, in so favourable a medium. The spring of importunate necessity there soon loses its force, and consequently the wheels of invention that depend upon it, fail to perform more than a few
few simple revolutions. In regions less mild, this original motive to industry and ingenuity, carries men to greater lengths, in the application of arts to the occasions of life; and these, of course, in an equal space of time, attain to greater perfection, than among the inhabitants of the tropical latitudes, who find their immediate wants supplied with facility, and prefer the negative pleasure of inaction, to the enjoyment of any conveniences that are to be purchased with exertion and labour. This consideration may perhaps tend to reconcile the high antiquity universally allowed to Asiatic nations, with the limited progress of arts and sciences among them; in which they are manifestly surpassed by people who, compared with them, are but of very recent date.

The Sumatrans, however, in the construction of their habitations, have stept many degrees beyond those rude contrivances which writers describe the inhabitants of some other Indian countries to have been contented with adopting, in order to screen themselves from the immediate influence of surrounding elements. Their houses are not only permanent, but convenient, and are built in the vicinity of each other, that they may enjoy the advantages of mutual assistance and protection, resulting from a state of society.*

The *dusuns* or villages (for the small number of inhabitants assembled in each does not entitle them to the appellations of towns) are always situated on the banks of a river or lake, for the convenience of bathing, and of transporting goods. An eminence difficult of ascent is usually made choice of for security. The access to them is by foot-ways, narrow and winding, of which there are seldom more than two; one to the country, and the other to the water; the latter in most places so steep, as to render it necessary to cut steps in the cliff or rock. The *dusuns* being surrounded with abundance of fruit trees, some of considerable height, as the *durian*, *coco*, and *betel-nut*, and the neighbouring country, for

* In several of the small islands near Sumatra (including the *Nicobars*) whose inhabitants in general are in a very low state of civilisation, the houses are built circularly. Vid. As. Researches, vol. iv. p. 129. plate.
for a little space about, being in some degree cleared of wood for the rice and pepper plantations, these villages strike the eye at a distance as clumps merely, exhibiting no appearance of a town or any place of habitation. The rows of houses form commonly a quadrangle, with passages or lanes at intervals between the buildings, where, in the more considerable villages, live the lower class of inhabitants, and where also their *padi*-houses or granaries are erected. In the middle of the square stands the *balei* or town hall, a room about fifty to an hundred feet long, and twenty or thirty wide, without division, and open at the sides, excepting when on particular occasions it is hung with mats or chintz; but sheltered in a lateral direction by the deep overhanging roof.

In their buildings neither stone, brick, nor clay, are ever made use of, which is the case in most countries where timber abounds, and where the warmth of the climate renders the free admission of air, a matter rather to be desired, than guarded against: but in Sumatra the frequency of earthquakes is alone sufficient to have prevented the natives from adopting a substantial mode of building. The frames of the houses are of wood, the underplate resting on pillars of about six or eight feet in height, which have a sort of capital, but no base, and are wider at top than at bottom. The people appear to have no idea of architecture as a science, though much ingenuity is often shewn in the manner of working up their materials, and they have, the Malays at least, technical terms corresponding to all those employed by our house carpenters. Their conception of proportions is extremely rude, often leaving those parts of a frame which have the greatest bearing, with the weakest support, and lavishing strength upon inadequate pressure. For the floorings they lay whole *bamboos* (a well known species of large cane) of four or five inches diameter, close to each other, and fasten them at the ends to the timbers. Across these are laid laths of split bamboo, about an inch wide and of the length of the room, which are tied down with filaments of the *rattan*; and over these are usually spread mats of different kinds. This sort of flooring has an elasticity alarming to strangers when they first tread on it. The sides of the houses are generally closed in with *palupo,* which is the bamboo opened, and rendered flat by notching or splitting the circular joints on the outside, chipping away the corresponding
ponding divisions within, and laying it to dry in the sun, pressed down with weights. This is sometimes nailed on to the upright timbers or bamboos, but in the country parts, it is more commonly interwoven, or matted, in breadths of six inches, and a piece, or sheet, formed at once of the size required. In some places they use for the same purpose the kulitkayu, or coolicoy, as it is pronounced by the Europeans, who employ it on board ship, as dunnage, in pepper and other cargoes. This is a bark procured from some particular trees, of which the bunut and ibu are the most common. When they prepare to take it, the outer rind is first torn or cut away; the inner, which affords the material, is then marked out with a prang, pateel, or other tool, to the size required, which is usually three cubits by one; it is afterwards beaten for some time with a heavy stick, to loosen it from the stem, and being peeled off, is laid in the sun to dry, care being taken to prevent its warping. The thicker or thinner sorts of the same species of kulitkayu, owe their difference to their being taken nearer to, or farther from, the root. That which is used in building has nearly the texture and hardness of wood. The pliable and delicate bark of which clothing is made, is procured from a tree called kalawoi, a bastard species of the bread-fruit.

The most general mode of covering houses is with the atap, which is the leaf of a species of palm called nipah. These, previous to their being laid on, are formed into sheets of about five feet long, and as deep as the length of the leaf will admit, which is doubled at one end over a slip or lath of bamboo; they are then disposed on the roof, so as that one sheet shall lap over the other, and are tied to the bamboos which serve for rafters. There are various other and more durable kinds of covering used. The kulitkayu, before described, is sometimes employed for this purpose: the galumpei—this is a thatch of narrow, split bamboos, six feet in length, placed in regular layers, each reaching within two feet of the extremity of that beneath it, by which a treble covering is formed: iju—this is a vegetable production, so nearly resembling horse-hair, as scarcely to be distinguished from it. It envelops the stem of that species of palm called anau, from which the best toddy or palm wine is procured, and is employed by the natives for a great variety of
purposes. It is bound on as a thatch, in the manner we do straw, and not unfrequently over the galumpei; in which case the roof is so durable as never to require renewal, the iju being of all vegetable substances the least prone to decay, and for this reason it is a common practice to wrap a quantity of it round the ends of timbers or posts which are to be fixed in the ground. I saw a house about twenty miles up Manna River, belonging to Dupati Bandar Agung, the roof of which was of fifty years standing. The larger houses have three pitches in the roof; the middle one, under which the door is placed, being much lower than the other two. In smaller houses there are but two pitches which are always of unequal height, and the entrance is in the smaller, which covers a kind of hall, or cooking room.

There is another kind of house, erected mostly for a temporary purpose, the roof of which is flat, and is covered in a very uncommon, simple, and ingenious manner. Large, straight bamboos are cut of a length sufficient to lie across the house, and being split exactly in two, and the joints knocked out, a first layer of them is disposed in close order, with the inner or hollow sides up; after which a second layer, with the outer or convex sides up, is placed upon the others in such manner, that each of the convex falls into the two contiguous concave pieces, covering their edges; the latter serving as gutters to carry off the water that falls upon the upper or convex layer.*

The mode of ascent to the houses is by a piece of timber, or stout bamboo, cut in notches, which latter an European cannot avail himself of, especially as the precaution is seldom taken of binding them fast. These are the wonderful light scaling ladders, which the old Portuguese writers described to have been used by the people of Achin in their wars with their nation. It is probable that the apprehension of danger from the wild beasts, caused them to adopt and continue this rude expedient, in preference to more regular and commodious steps. The detached buildings

---

*I find that the original inhabitants of the Philippine islands covered their buildings in the same manner.
buildings in the country, near to their plantations, called talângs, they raise to the height of ten or twelve feet from the ground, and make a practice of taking up their ladder at night, to secure themselves from the destructive ravages of the tigers. I have been assured, but do not pledge myself for the truth of the story, that an elephant, attempting to pass under one of these houses, which stand on four or six posts, stuck by the way; but disdaining to retreat, carried it, with the family it contained, on his back, to a considerable distance.

In the buildings of the dusuns, particularly where the most respectable families reside, the wood-work in front is carved, in the style of bas-relief, in a variety of uncouth ornaments and grotesque figures, not much unlike the Egyptian hieroglyphics, but certainly without any mystic or historical allusion.

The furniture of their houses, corresponding with their manner of living, is very simple, and consists of but few articles. Their bed is a mat, usually of fine texture, and manufactured for the purpose, with a number of pillows, worked at the ends, and adorned with a shining substance that resembles foil. A sort of canopy or valance, formed of various coloured cloths, hangs over head. Instead of tables, they have what resemble large wooden salvers, with feet, called dulang; round each of which three or four persons dispose themselves; and on these are laid the talams or brass waiters, which hold the cups that contain their curry, and plantain leaves, or matted vessels, filled with rice. Their mode of sitting is not cross-legged, as the inhabitants of Turkey and our tailors use, but either on the haunches, or on the left side, supported by the left hand, with the legs tucked in on the right side; leaving that hand at liberty, which they always, from motives of delicacy, scrupulously eat with; the left being reserved for less cleanly offices. Neither knives, spoons, nor any substitutes for them, are employed; they take up the rice, and other victuals, between the thumb and fingers, and dexterously throw it into the mouth by the action of the thumb, dipping frequently their hands in water as they eat.

The have a little coarse china ware, imported by the eastern praws, utensils, which
which is held a matter of luxury. In cooking they employ a kind of iron vessel, well known in India by the name of quailie or tauch, resembling in shape the pans used in some of our manufactures, having the rim wide, and bottom narrow. These are likewise brought from the eastward. The priu and balaniga, species of earthen pipkins, are in more common use, being made in small quantities in different parts of the island, particularly in Lampong, where they give them a sort of glazing; but the greater number of them are imported from Bantam. The original Sumatran vessel for boiling rice, and which is still much used for that purpose, is the bamboo; that material of general utility, with which bountiful nature has supplied an indolent people. By the time the rice is dressed, the utensil is nearly destroyed by the fire, but resists the flame so long as there is moisture within.

Fire being wanted among these people but occasionally, and only when they cook their victuals, there is not much attention paid, in their buildings, to provide conveniences for it. Their houses have no chimneys, and their fire-places are no more than a few loose bricks or stones, disposed in a temporary manner, and frequently on the landing-place before the doors. The fuel made use of is wood alone; the coal which the island produces never being converted by the inhabitants to that purpose. The flint and steel for striking fire are common in the country, but it is a practice certainly borrowed from some other people, as that species of stone is not a native of the soil. These generally form part of their travelling apparatus, and especially with those men called risaus (spendthrifts that turn freebooters), who find themselves often obliged to take up their habitation in the woods, or in deserted houses. But they also frequently kindle fire from the friction of two sticks. They chuse a piece of dry, porous wood, and cutting smooth a spot of it, lay it in an horizontal direction. They then apply a smaller piece, of a harder substance, with a blunt point, in a perpendicular position, and turn it quickly round, between the two hands, as chocolate is milled, pressing it downwards at the same time. A hole is soon formed by this motion of the smaller stick; but it has not penetrated far before the larger one takes fire. I have also seen the same effect produced, more
more simply, by rubbing one bit of bamboo, with a sharp edge, across another.\footnote{This mode of kindling fire is not peculiar to Sumatra: we read of the same practice in Africa, and even in Kamtschatka. It is surprising, but confirmed by abundant authority, that many nations of the earth, have, at certain periods, being ignorant of the use of fire. To our immediate apprehension, human existence would seem in such circumstances impossible. Every art, every convenience, every necessary of life, is now in the most intimate manner connected with it: and yet the Chinese, the Egyptians, the Phenicians, and Greeks, acknowledged traditions concerning its first discovery in their respective countries. But, in fact, if we can once suppose a man, or society of men, unacquainted with the being and uses of this element, I see no difficulty in conceiving the possibility of their supporting life without it; I mean in the tropical climates; and of centuries passing before they should arrive at the important discovery. It is true, that lightning and its effects, volcanos, the firing of dry substances by fortuitous attrition, or of moist, by fermentation, might give them an idea of its violent and destructive properties; but far from being thence induced to appropriate and apply it, they would, on the contrary, dread and avoid it, even in its less formidable appearances. They might be led to worship it as their deity, but not to cherish it as their domestic. There is some reason to conclude that the man who first reduced it to subjection, and rendered it subservient to the purposes of life, procured it from the collision of two flints; but the sparks thus produced, whether by accident or design, might be observed innumerable times, without its suggesting a beneficial application. In countries where those did not present themselves, the discovery had, most probably, its origin in the rubbing together of dry sticks, and in this operation, the agent and subject co-existing, flame, with its properties and uses, became more immediately apparent. Still, as no previous idea was conceived of this latent principle, and consequently no search made, no endeavours exerted, to bring it to light, I see not the impossibility a priori, of its remaining almost as long concealed from mankind, as the properties of the loadstone, or the qualities of gunpowder.}

Water is conveyed from the spring, in bamboos, which, for this purpose are cut, either to the length of five or six feet, and carried over the shoulder, or into a number of single joints, that are put together in a basket. It is drunk out of the fruit called lahu here, resembling the calabash of the West Indies, a hole being made in the side of the neck, and another at top for vent. In drinking, they generally hold the vessel at a distance above their mouths, and catch the stream as it falls; the liquid descending to the stomach without the action of swallowing. Baskets (bronong, bakül) are a considerable part of the furniture of a man’s
man's house, and the number of these seen hanging up, are tokens of the owner's substance; for in them his harvests, of rice or pepper, are gathered and brought home; no carts being employed in the interior parts of the island which I am now describing. They are made of slips of bamboo, connected by means of split rattans; and are carried, chiefly by the women, on the back, supported by a string or band across the forehead.

Although the Sumatrans live, in a great measure, upon vegetable food, they are not restrained, by any superstitious opinion, from other alements, and accordingly, at their entertainments, the flesh of the buffalo (karbau), goat, and fowls, are served up. Their dishes are almost all prepared in that mode of dressing to which we have given the name of curry (from a Hindostanic word), and which is now universally known in Europe. It is called in the Malay language, gūlei, and may be composed of any kind of edible, but is generally of flesh or fowl, with a variety of pulse and succulent herbage, stewed down with certain ingredients, by us termed, when mixed and ground together, curry-powder. These ingredients are, among others, the cayenne or chili pepper, turmeric, sarei or lemon-grass, cardamums, garlick, and the pulp of the coconut bruised to a milk resembling that of almonds, which is the only liquid made use of. This differs from the curries of Madras and Bengal, which have greater variety of spices, and want the coconut. It is not a little remarkable, that the common pepper, the chief produce and staple commodity of the country, is never mixed by the natives in their food. They esteem it heating to the blood, and ascribe a contrary effect to the cayenne; which, I can say, my own experience justifies. A great diversity of curries is usually served up at the same time, in small vessels, each flavoured, to a nice discerning taste, in a different manner; and in this consists all the luxury of their tables. Let their quantity, or variety, or meat, be what it may, the principle article of their food is rice, which is eaten in a large proportion with every dish, and very frequently without any other accompaniment than salt and chili pepper. It is prepared by boiling in a manner peculiar to India; its perfection, next to cleanness and whiteness, consisting in its being, when thoroughly dressed and soft to the heart, at the same time whole and
and separate, so that no two grains shall adhere together. The manner of effecting this, is by putting into the earthen or other vessel in which it is boiled a quantity of water sufficient to cover it; letting it simmer over a slow fire; taking off the water by degrees with a flat ladle or spoon, that the grain may dry, and removing it when just short of burning. At their entertainments, the guests are treated with rice prepared also in a variety of modes, by frying it in cakes, or boiling a particular species of it, mixed with the kernel of the coconut and fresh oil, in small joints of bamboo. This is called lemmang. Before it is served up, they cut off the outer rind of the bamboo, and the soft inner coat is peeled away by the person who eats.

They dress their meat immediately after killing it, while it is still warm, which is conformable with the practice of the ancients, as recorded in Homer and elsewhere, and in this state it is said to eat tenderer than when kept for a day: longer the climate will not admit of, unless when it is preserved in that mode called dinding. This is the flesh of the buffalo cut into small thin steaks, and exposed to the heat of the sun in fair weather, generally on the thatch of their houses, till it is become so dry and hard as to resist putrefaction, without any assistance from salt. Fish is preserved in the same manner, and cargoes of both are sent from parts of the coast, where they are in plenty, to those where provisions are in more demand. It is seemingly strange, that heat, which, in a certain degree, promotes putrefaction, should, when violently increased, operate to prevent it; but it must be considered that moisture also is requisite to the former effect, and this is absorbed in thin substances, by the sun's rays, before it can contribute to the production of maggots.

Blachang, a preservation, if it may be so termed, of an opposite kind, is esteemed a great delicacy among the Malays, and is by them exported to the west of India. The country Sumatrans seldom procure it. It is a species of caviare, and is extremely offensive and disgusting to persons who are not accustomed to it, particularly the black kind, which is the most common. The best sort, or the red blachang, is made of the spawn of shrimps, or of the shrimps themselves, which they take about the mouths of rivers. They are, after boiling, exposed to the sun to dry; then
then pounded in a mortar, with salt, moistened with a little water, and formed into cakes, which is all the process. The black sort, used by the lower class, is made of small fish, prepared in the same manner. On some parts of the east coast of the island, they salt the roes of a large fish of the shad kind, and preserve them perfectly dry, and well flavoured. These are called *trobo*.

When the natives kill a buffalo, which is always done at their public meetings, they do not cut it up into joints, as we do an ox, but into small pieces of flesh, or steaks, which they call *bantei*. The hide of the buffalo is sometimes scalded, scraped, and hung up to dry in their houses, where it shrivels and becomes perfectly hard. When wanted for use, a piece is chopped off, and being stewed down for a great number of hours, in a small quantity of water, forms a rich jelly, which, properly seasoned, is esteemed a very delicate dish.

The sago (*sagu*), though common on Sumatra, and used occasionally by the natives, is not an article of food of such general use among them, as with the inhabitants of many other eastern islands, where it is employed as a substitute for rice. Millet (*randa jawa*) is also cultivated for food, but not in any considerable quantity.

When these several articles of subsistence fail, the Sumatran has recourse to those wild roots, herbs, and leaves of trees, which the woods abundantly afford in every season, without culture, and which the habitual simplicity of his diet teaches him to consider as no very extraordinary circumstance of hardship. Hence it is that famines in this island, or, more properly speaking, failures of crops of grain, are never attended with those dreadful consequences, which more improved countries and more provident nations experience.

*Agriculture.*
SUMATRA.

Agriculture.—Rice, its Cultivation, &c.—Plantations of Coconut, Betel-nut, and other Vegetables for domestic Use.—Dye Stuffs.

FROM their domestic economy I am led to take a view of their labours Agriculture, in the field, their plantations and the state of agriculture amongst them, which an ingenious writer esteems the justest criterion of civilization.

The most important article of cultivation, not in Sumatra alone, but rice throughout the East, is rice. It is the grand material of food, on which an hundred millions of the inhabitants of the earth subsist, and although chiefly confined by nature to the regions included between, and bordering on the tropics, its cultivation is probably more extensive than that of wheat, which the Europeans are wont to consider as the universal staff of life. In the continent of Asia, as you advance to the northward, you come to the boundary where the plantations of rice disappear, and the wheat fields commence; the cold felt in that climate, owing in part to the height of the land, being unfriendly to the production of the former article.

Rice (oryza sativa) whilst in the husk is called padi by the Malays (from whose language the word seems to have found its way to the maritime parts of the continent of India), bras when deprived of the husk, and nasi after it has been boiled; besides which it assumes other names in its various states of growth and preparation. This minuteness of distinction applies also to some other articles of common use, and may be accounted for upon this principle; that amongst people whose general objects of attention are limited, those which do of necessity occupy them, are liable to be more the subject of thought and conversation than in more enlightened countries, where the ideas of men have an extensive range. The kinds of rice also (whether technically of different species I cannot pronounce) are very numerous, but divided in the first place into
into the two comprehensive classes of *padi ladang* or upland, from its growing in high, dry grounds, and *padi sawah* (vulgarly pronounced *sawur* or *sour*) or low-land, from its being planted in marshes; each of which is said to contain ten or fifteen varieties, distinct in shape, size, and colour of the grain, modes of growth, and delicacy of flavour; it being observed that in general the larger grained rice is not so much prized by the natives as that which is small, when at the same time white and in some degree transparent. To M. Poivre, in his *Travels of a Philosopher*, we are indebted for first pointing out these two classes, when speaking of the agriculture of Cochin-China. The qualities of the *ladang*, or upland rice, are held to be superior to those of the *sawah*, being whiter, more nourishing, better tasted, and having the advantage in point of keeping. Its mode of culture, too, is free from the charge of unhealthiness attributed to the latter, which is of a watery substance, is attended with

* The following sorts of dry-ground *padi* have come under my notice, but as the names vary in different districts, it is possible that some of these may be repetitions, where there is no striking difference of character—*Padi Ebbus*, large grain, very common;—*Andalong*, short round grain, grows in whorles or bunches round the stalk, common;—*Galu*, light coloured, scarce;—*Sini*, small grain, deep coloured, scarce;—*Jüz*, lightish colour, scarce;—*Kuning*, deep yellow, crooked and pointed, fine rice;—*Kukur-ballum*, small, much crooked and resembling a dove's claw, from whence the name; light coloured, highly esteemed for its delicate flavour;—*Pisang*, outer coat light brown, inner red, longer, smaller, and less crooked than the preceding;—*Bründin*, long, flattish, ribbed, pointed, dead yellow;—*Bijut*, shaped like the preceding, but with a tinge of red in the colour;—*Chariap*, short, roundish, reddish yellow;—*Jainggut*, or bearded, small, narrow, pale brown;—*Jambi*, small, somewhat crooked and pointed, light brown;—*Laye*, gibbous, light coloured;—*Musang*, long, small, crooked and pointed, deep purple;—*Pandalon*, small, light coloured;—*Paž*, long, crooked and pointed, light yellow;—*Puyah*, small, delicate, crooked and pointed, bright ochre;—*Rakkun*, roundish grain, resembles the *andalong*, but larger and deeper colour;—*Shong*, much resembles the *Laye* in shape and colour;—*Sutar*, short, roundish, bright, reddish brown;—*Pulut gading* or ivory, long, nearly straight, light yellow;—*Pulut kechil*, small, crooked, reddish yellow;—*Pulut bran*, long and rather large grain, purple, when fresh more nearly red;—*Pulut bran lematur*, in shape like the preceding, but of a dead pale colour. Beside these four there is also a black kind of *Pulut*. Samples of most of these have been in my possession for a number of years, and still continue perfectly sound. Of the sorts of rice growing in low grounds I have not specimens. The *padi santong*, which is small, straight, and light coloured, is held to be the finest. In the Lampong country they make a distinction of *padi krawang* and *padi jern*, of which I know nothing more than that the former is a month earlier in growth than the latter.
with less increase in boiling, and is subject to a swifter decay; but of this the rate of produce from the seed is much greater, and the certainty of the crops more to be depended on. It is accordingly cheaper, and in more common use. The seed of each sort is kept separate by the natives, who assert that they will not grow reciprocally.

For the cultivation of upland padi the site of woods is universally preferred, and the more ancient the woods the better, on account of the superior richness of the soil; the continual fall and rotting of the leaves forming there a bed of vegetable mould, which the open plains do not afford, being exhausted by the powerful operation of the sun’s rays, and the constant production of a rank grass called lalang. When this grass, common to all the eastern islands, is kept under by frequent mowing or the grazing of cattle (as is the case near the European settlements), its room is supplied by grass of a finer texture. Many suppose that the same identical species of vegetable undergoes this alteration, as no fresh seeds are sown, and the substitution uniformly takes place. But this is an evident mistake, as the generic characters of the two are essentially different; the one being the gramen caricosum, and the other the gramen aciculatum, described by Rumphius. The former, which grows to the height of five feet, is remarkable for the whiteness and softness of the down or blossom, and the other for the sharpness of its bearded seeds, which prove extremely troublesome to the legs of those who walk among it. If old woods are not at hand, ground covered with that of younger growth, termed balūkar, is resorted to; but not, if possible, under the age

\textsuperscript{a} "Gramen hoc (caricosum) totos occupat campos, nudosque, colles tam densē et latē germinans, ut e longinquō haberetur campus oryza consitus, tam luxuriosē ac fortiter crescit, ut neque hortos neque sylvas evit, atque tam vehementer prorepit, ut areae vix depurari ac servari possint, licet quotidie deambulantur . . . . . . Potissimum amat solum flavum arguillosum." (Gramen aciculatum) "Usus ejus fērē nullus est, sed hic detegendum est tædiosum luidibrium, quod quis habet, si quis per campos vel in sylvis procedat, ubi hoc gramen ad vias publicas crescit, quam prætercentium vestibus, hoc semen quam maxime inharēt." Rumphius, vol. vi. lib. x. chap. S. and 13. M. Poivre describes the plains of Madagascar and Java as covered with a long grass which he calls Fatak, and which from the analogy of the countries in other respects, I should suppose to be the lalang; but he praises it as affording excellent pasturage; whereas in Sumatra it is reckoned the worst, and except when very young it is not edible by the largest cattle; for which reason the carters
age of four or five years. Vegetation is there so strong, that spots which had been perfectly cleared for cultivation, will, upon being neglected for a single season, afford shelter to the beasts of the forest; and the same being rarely occupied for two successive years, the face of the country continues to exhibit the same wild appearance, although very extensive tracts are annually covered with fresh plantations. From this it will be seen, that in consequence of the fertility to which it gives occasion, the abundance of wood in the country is not considered by the inhabitants as an inconvenience, but the contrary. Indeed I have heard a native prince complain of a settlement made by some persons of a distant tribe in the inland part of his dominions, whom he should be obliged to expel from thence, in order to prevent the waste of his old woods. This seemed a superfluous act of precaution in an island which strikes the eye as one general, impervious, and inexhaustible forest.

On the approach of the dry monsoon (April and May) or in the course of it, the husbandman makes choice of a spot for his ladang, or plantation of upland rice, for that season, and marks it out. Here it must be observed that property in land depends upon occupancy, unless where fruit-bearing trees have been planted, and as there is seldom any determined boundary between the lands of neighbouring villages, such marks are rarely disturbed. Collecting his family and dependants he next proceeds to clear the ground. This is an undertaking of immense labour, and would seem to require herculean force, but it is effected by skill and perseverance. The work divides itself into two parts. The first (called tebbas, menebbas) consists in cutting down the brushwood, and rank vegetables, which are suffered to dry during an interval of a fortnight, or more or less, according to the fairness of the weather, before they proceed to the second operation (called tebbang, menebbang) of felling the large trees. Their tools, the prang and billion (the former resembling a bill-hook, and the latter an imperfect adze) are seemingly inadequate to the task, and the saw is unknown in the country. Being regardless of the timber, they do not fell the tree near the ground, where the stem is

and drovers are in the practice of setting fire to that which grows on the plains, by the roadside, that the young shoots which thereupon shoot up, may afterwards supply food to their buffaloes.
is thick, but erect a stage, and begin to hew, or chop rather, at the height of ten or twelve, to twenty or thirty feet, where the dimensions are smaller (and sometimes much higher, taking off little more than the head) until it is sufficiently weakened to admit of their pulling it down with rattans made fast to the branches, instead of ropes.* And thus by slow degrees the whole is laid low. In some places, however, a more summary process is attempted. It may be conceived that in the woods the cutting down trees singly is a matter of much difficulty, on account of the twining plants which spread from one to the other and connect them strongly together. To surmount this, it is not an uncommon practice to cut a number of trees half-through, on the same side, and then fix upon one of great bulk, at the extremity of the space marked out, which they cut nearly through, and having disengaged it from these lianes (as they are termed in the western world) determine its fall in such a direction as may produce the effect of its bearing down by its prodigious weight all those trees which had been previously weakened for the purpose. By this much time and labour are saved, and the object being to destroy and not to save the timber, the rending or otherwise spoiling the stems is of no moment. I could never behold this devastation without a strong sentiment of regret. Perhaps the prejudices of a classical education taught me to respect those aged trees as the habitation or material frame of an order of sylvan deities, who were now deprived of existence by the sacrilegious hand of a rude, undistinguished savage. But without having recourse to superstition, it is not difficult to account for such feelings on the sight of a venerable wood, old, to appearance, as the soil it stood on, and beautiful beyond what pencil can describe, annihilated for the temporary use of the space it occupied. It seemed a violation of nature, in the too arbitrary exercise of power. The timber, from its abundance, the smallness of consumption, and its distance in most cases from the banks of navigable rivers, by which means alone it could be transported to any distance, is of no value; and trees whose bulk, height, straightness of stem, and extent of limbs, excite the admiration of a traveller, perish indiscriminately. Some of the branches are lopped off, and when these, together with the underwood, are become

* A similar mode of felling is described in the "Maison rustique de Cayenne."
come sufficiently arid, they are set fire to, and the country, for the space of a month or two, is in a general blaze and smoke, until the whole is consumed, and the ground effectually cleared. The expiring wood, benificent to its ungrateful destroyer, fertilizes for his use, by its ashes and their salts, the earth which it so long adorned.

Unseasonable wet weather at this period, which sometimes happens, and especially when the business is deferred till the close of the dry or south-east monsoon, whose termination is at best irregular, produces much inconvenience by the delay of burning, till the vegetation has had time to renew itself; in which case the spot is commonly abandoned; or, if partially burned, it is not without considerable toil that it can be afterwards prepared for sowing. On such occasions there are impostors ready to make a profit of the credulity of the husbandman who, like all others whose employments expose them to risks, are prone to superstition, by pretending to a power of causing or retarding rain. One of these will receive, at the time of burning the ladangs, a dollar or more from each family in the neighbourhood, under the pretence of insuring favourable weather for their undertaking. To accomplish this purpose, he abstains, or pretends to abstain, for many days and nights, from food and sleep, and performs various trifling ceremonies; continuing all the time in the open air. If he espies a cloud gathering, he immediately begins to smoke tobacco with great vehemence, walking about with a quick pace, and throwing the puffs towards it with all the force of his lungs. How far he is successful it is no difficult matter to judge. His skill, in fact, lies in chusing his time, when there is the greatest prospect of the continuance of fair weather in the ordinary course of nature: but should he fail, there is an effectual salvo. He always promises to fulfil his agreement with a Deo volente clause, and so attributes his occasional disappointments to the particular interposition of the deity. The cunning men who, in this and many other instances of conjuration, impose on the simple country people, are always Malayan adventurers, and not unfrequently priests. The planter whose labour has been lost by such interruptions, generally finds it too late in the season to begin on another ladang, and the ordinary resource for subsisting himself and family, is to seek a spot of sawah ground, whose cultivation is less dependant upon
upon accidental variations of weather. In some districts much confusion in regard to the period of sowing is said to have arisen from a very extraordinary cause. Anciently, say the natives, it was regulated by the stars, and particularly by the appearance (heliacal rising) of the bintang baniak or pleiades; but after the introduction of the Mahometan religion, they were induced to follow the returns of the puāsa or great annual fast, and forgot their old rules. The consequence of this was obvious; for the lunar year of the hejrah being eleven days short of the sydereal or solar year, the order of the seasons was soon inverted; and it is only astonishing that its inaptness to the purposes of agriculture should not have been immediately discovered.

When the periodical rains begin to fall, which takes place gradually about October, the planter assembles his neighbours (whom he assists in turn), and with the aid of his whole family proceeds to sow his ground, endeavouring to complete the task in the course of one day. In order to ensure success, he fixes, by the priest's assistance, on a lucky day, and vows the sacrifice of a kid, if his crop should prove favourable; the performance of which is sacredly observed, and is the occasion of a feast in every family after harvest. The manner of sowing (tūgal-menūgal) is this. Two or three men enter the plantation, as it is usual to call the padi-field, holding in each hand sticks about five feet long and two inches diameter, bluntly pointed, with which, striking them into the ground as they advance, they make small, shallow holes, at the distance of about five inches from each other. These are followed by the women and elder children with small baskets containing the seed-grain (saved with care from the choicest of the preceding crop) of which they drop four or five grains into every hole, and passing on, are followed by the younger children, who with their feet (in the use of which the natives are nearly as expert as with their hands) cover them lightly from the adjacent earth, that the seed may not be too much exposed to the birds, which, as might be expected, often prove destructive foes. The ground, it should be observed, has not been previously turned up by any instrument of the hoe or plough kind, nor would the stumps and roots of trees remaining in it admit of the latter being worked; although employed under other circumstances, as will hereafter appear. If rain succeeds, the
the padi is above ground in four or five days; but by an unexpected run of dry weather, it is sometimes lost, and the field sowed a second time. When it has attained a month or six weeks' growth, it becomes necessary to clear it of weeds (siang-menjang), which is repeated at the end of two months or ten weeks; after which the strength it has acquired is sufficient to preserve it from injury in that way. Huts are now raised in different parts of the plantation, from whence a communication is formed over the whole by means of rattans, to which are attached scarecrows, rattles, clappers, and other machines for frightening away the birds, in the contrivance of which they employ incredible pains and ingenuity; so disposing them that a child, placed in the hut, shall be able, with little exertion, to create a loud, clattering noise, to a great extent; and on the borders of the field are placed at intervals a species of windmill fixed on poles, which, on the unexperienced traveller, have an effect as terrible as those encountered by the knight of La Mancha. Such precautions are indispensable for the protection of the corn, when in the ear, against the numerous flights of the pipi, a small bird with a light brown body, white head, and bluish beak, rather less than the sparrow, which in its general appearance and habits it resembles. Several of these lighting at once upon a stalk of padi, and bearing it down, soon clear it of its produce, and thus, if unmolested, destroy whole crops.

At the time of sowing the padi, it is a common practice to sow also, in the interstices, and in the same manner, jagong or maiz, which growing up faster, and ripening before it (in little more than three months) is gathered without injury to the former. It is also customary to raise in the same ground a species of momordica, the fruit of which comes forward in the course of two months.

Reaping.

The nominal time allowed from the sowing to the reaping of the crop is five lunar months and ten days; but from this it must necessarily vary with the circumstances of the season. When it ripens, if all at the same time, the neighbours are again summoned to assist, and entertained for the day: if a part only ripens first, the family begin to reap it, and proceed through the whole by degrees. In this operation, called tuwei-menuwei
from the instrument used, they take off the head of corn (the term of "ear" not being applicable to the growth of this plant) about six inches below the grain, the remaining stalk or halm being left as of no value. The tuwei is a piece of wood about six inches long, usually of carved work, and about two inches diameter, in which is fixed lengthwise a blade of four or five inches, secured at the extremes by points bent to a right angle, and entering the wood. To this is added a piece of very small bamboo from two to three inches long, fixed at right angles across the back of the wood, with a notch for receiving it, and pinned through by a small peg. This bamboo rests in the hollow of the hand, one end of the piece of wood passing between the two middle fingers, with the blade outwards; the natives always cutting from them. With this in the right hand, and a small basket slung over the left shoulder, they very expeditiously crop the heads of padi one by one, bringing the stalk to the blade with their two middle fingers, and passing them, when cut, from the right hand to the left. As soon as the left hand is full, the contents are placed in regular layers in the basket (sometimes tied up in a little sheaf), and from thence removed to larger baskets, in which the harvest is to be conveyed to the dusun or village, there to be lodged in the tangkian or barns, which are buildings detached from the dwelling-houses, raised like them from the ground, widening from the floor towards the roof, and well lined with boards or coolitcoy. In each removal care is taken to preserve the regularity of the layers, by which means it is stowed to advantage, and any portion of it readily taken out for use.

Sawahs are plantations of padi in low, wet ground, which, during the growth of the crop, in the rainy season between the months of October and March, are for the most part overflowed to the depth of six inches or

a The inhabitants of Menangkabau are said to reap with an instrument resembling a sickle.

b In the Trans. of the Batavian Society the following mention is made of the cultivation of rice in Java. The padi sawa is sown in low, watered grounds, in the month of March, transplanted in April, and reaped in August. The padi tipar is sown in high, ploughed lands,
or a foot, beyond which latter the water becomes prejudicial. Leve
marshes, of firm bottom, under a moderate stratum of mud, and not
liable to deep stagnant water, are the situations preferred; the narrower
hollows, though very commonly used for small plantations, being more
liable to accidents from torrents and too great depth of water, which
the inhabitants have rarely industry enough to regulate to advantage by
permanent embankments. They are not, however, ignorant of such
expedients, and works are sometimes met with, constructed for the pur-
pose, chiefly, of supplying the deficiency of rain to several adjoining
sawahs, by means of sluices, contrived with no small degree of skill and
attention to levels.

In new ground, after clearing it from the brushwood, reeds, and aqua-
tic vegetables with which the marshes, when neglected are overrun, and
burning them at the close of the dry season, the soil is, in the begin-
ning of the wet, prepared for culture by different modes of working.
In some places a number of buffaloes, whose greatest enjoyment con-
sists in wading and rolling in mud, are turned in, and these by their
motions contribute to give it a more uniform consistence, as well as en-
rich it by their dung. In other parts less permanently moist, the soil
is turned up either with a wooden instrument between a hoe and a pick-
axe, or with the plough, of which they use two kinds; their own, drawn
by one buffalo, extremely simple, and the wooden share of it doing little
more than scratch the ground to the depth of six inches; and one they
have borrowed from the Chinese, drawn either with one or two buffa-
loes, very light, and the share more nearly resembling ours, turning the
soil over as it passes, and making a narrow furrow. In sawahs, how-
ever, the surface has in general so little consistence, that no furrow is
perceptible, and the plough does little more than loosen the stiff mud to
some depth, and cut the roots of the grass and weeds, from which it is
afterwards cleared by means of a kind of harrow or rake, being a thick
plank

lands, in November, and reaped in March (earlier in the season than I could have sup-
pposed). When sown where woods have been recently cut down, or in the clefts of the hills
(klooven van het gebergte) it is named padi gaga. Vol. 1. p. 27.
plank of heavy wood, with strong wooden teeth, and loaded with earth where necessary. This they contrive to drag along the surface, for the purpose, at the same time, of depressing the rising spots and filling up the hollow ones. The whole being brought as nearly as possible to a level, that the water may lie equally upon it, the sawah is, for the more effectual securing of this essential point, divided into portions nearly square or oblong (called piring, which signifies a dish), by narrow banks raised about eighteen inches, and two feet wide. These drying become harder than the rest, confine the water, and serve the purpose of footways throughout the plantation. When there is more water in one division than another, small passages are cut through the dams, to produce an equality. Through these apertures water is also, in some instances, introduced from adjacent rivers or reservoirs, where such exist, and the season requires their aid. The innumerable springs and rivulets with which this country abounds, render unnecessary; the laborious processes by which water is raised and supplied to the rice grounds in the western part of India, where the soil is sandy: yet still the principal art of the planter consists, and is required, in the management of this article; to furnish it to the ground in proper and moderate quantities, and to carry it off from time to time by drains; for if suffered to be long stagnant, it would occasion the grain to rot.

Whilst the sawahs have been thus in preparation to receive the padi, a small, adjacent, and convenient spot of good soil has been chosen, in which the seed-grain is sown as thick as it can well lie on the ground, and is then often covered with layers of lalang (long grass, instead of straw) to protect the grain from the birds, and perhaps assist the vegetation. When it has grown to the height of from five to eight inches, or generally at the end of forty days from the time of sowing, it is taken up, in showery weather, and transplanted to the sawah, where holes are made four or five inches asunder to receive the plants. If they appear too forward, the tops are cropped off. A supply is at the same time reserved in the seed-plots to replace such as may chance to fail upon removal. These plantations, in the same manner as the ladangs, it is necessary to cleanse from weeds at least twice in the first two or three months; but no maiz or other seed is sown among the crop. When
the padi begins to form the ear, or to blossom, as the natives express it, the water is finally drawn off, and at the expiration of four months from the time of transplanting, it arrives at maturity. The manner of guarding against the birds is similar to what has been already described; but the low ground crop has a peculiar and very destructive enemy in the rats, which sometimes consume the whole of it, especially when the plantation has been made somewhat out of season; to obviate which evil, the inhabitants of a district sow by agreement pretty nearly at the same time; whereby the damage is less perceptible. In the mode of reaping, likewise, there is nothing different. Upon the conclusion of the harvest it is an indispensable duty to summon the neighbouring priests to the first meal that is made of the new rice, when an entertainment is given according to the circumstances of the family. Should this ceremony be omitted, the crop would be accursed (haram), nor could the whole household expect to outlive the season. This superstition has been by the Mahometans judiciously engrailed on the stock of credulity in the country people.

The same spot of low ground is for the most part used without regular intermission for several successive years, the degree of culture they bestow by turning up the soil, and the overflowing water, preserving its fertility. They are not, however, insensible to the advantage of occasional fallows. In consequence of this continued use the value of the sawah grounds differs from that of ladangs, the former being, in the neighbourhood of populous towns particularly, distinct property, and of regularly ascertained value. At Natal, for example, those containing between one and two acres sell for sixteen to twenty Spanish dollars. In the interior country, where the temperature of the air is more favourable to agriculture, they are said to sow the same spot with ladang rice for three successive years; and there also it is common to sow onions as soon as the stubble is burned off. Millet (randa jawa) is sown at the same time with the padi. In the country of Manna, southward of Bencoolen, a progress in the art of cultivation is discovered, superior to what appears in almost any other part of the island; the Batta country, perhaps, alone excepted. Here may be seen pieces of land in size from five to fifteen acres, regularly ploughed and harrowed. The difference is thus accounted
S U M A T R A.

accounted for. It is the most populous district in that southern part, with the smallest extent of sea-coast. The pepper plantations and ladangs together having in a great measure exhausted the old woods in the accessible parts of the country, and the inhabitants being therein deprived of a source of fertility which nature formerly supplied, they must either starve, remove to another district, or improve by cultivation the spot where they reside. The first is contrary to the inherent principle that teaches man to preserve life by every possible means: their attachment to their native soil, or rather their veneration for the sepulchres of their ancestors, is so strong, that to remove would cost them a struggle almost equal to the pangs of death: necessity, therefore, the parent of art and industry, compels them to cultivate the earth. The produce of the grounds thus tilled is reckoned at thirty for one; from those in the ordinary mode about an hundred fold on the average, the ladangs yielding about eighty, and the sawahs an hundred and twenty. Under favourable circumstances I am assured the rate of produce is sometimes so high as an hundred and forty fold. The quantity sown by a family is usually from five to ten bamboo measures or gallons. These returns are very extraordinary compared with those of our wheat-fields in Europe, which, I believe, seldom exceed fifteen, and are often under ten. To what is this disproportion owing? to the difference of grain, as rice may be in its nature extremely prolific? to the more genial influence of a warmer climate? or to the earth’s losing by degrees her secundity, from an excessive cultivation? Rather than to any of these causes, I am inclined to attribute it to the different process followed in sowing. In England the saving of labour and promoting of expedition are the chief objects, and in order to effect these, the grain is almost universally scattered in the furrows; excepting where the drill has been introduced. The Sumatrans, who do not calculate the value of their own labour or that of their domestics on such occasions, make holes in the ground, as has been described, and drop into each a few grains; or

* In an address from the Bath Agricultural Society, dated 12th October, 1795, it is strongly recommended to the cultivators of land (on account of the then existing scarcity of grain) to adopt the method of dibbling wheat. The holes to be made either by the common dibble, or
or by a process still more tedious, raise the seed in beds, and then plant it out. Mr. Charles Miller, in a paper published in the Phil. Trans. has shewn us the wonderful effects of successive transplantation. How far it might be worth the English farmer's while to bestow more labour in the business of sowing the grain, with the view of a proportionate increase in the rate of produce, I am not competent, nor is it to my present purpose, to form a judgment. Possibly as the advantage might be found to lie rather in the quantity of grain saved in the sowing, than gained in the reaping, it would not answer his purpose; for although half the quantity of seed-corn bears reciprocally the same proportion to the usual produce, that double the latter does to the usual allowance of seed, yet in point of profit the scale is different. To augment this, it is of much more importance to increase the produce from a given quantity of land, than to diminish the quantity of grain necessary for sowing it.

Notwithstanding the received opinion of the fertility of what are called the Malay Islands, countenanced by the authority of M. Poivre and other celebrated writers, and still more by the extraordinary produce of grain, as above stated, I cannot help saying that I think the soil of the western coast of Sumatra is in general rather sterile than rich. It is for the most part a stiff, red clay, burned nearly to the state of a brick, where it is exposed to the influence of the sun. The small proportion of the whole that is cultivated, is either ground from which old woods have been recently cleared, whose leaves had formed a bed of vegetable earth some inches deep, or else ravines into which the scanty mould of the adjoining hills has been washed by the annual torrents of rain. It is true, that in many parts of the coast there are, between the cliffs and the sea-beach,

or with an implement having four or more points in a frame, at the distance of about four inches every way, and to the depth of an inch and half; dropping two grains into every hole. The man who dibbles is to move backwards, and to be followed by two or three women or children, who drop in the grains. A bush-hurdle, drawn across the furrows by a single horse, finishes the business. About six pecks of seed-wheat per acre are saved by this method. The expense of dibbling, dropping, and covering, is reckoned, in Norfolk, at about six shillings per acre. (Times Newspaper of 20th of October, 1795.)
SUMATRA.

sea-beach, plains varying in breadth and extent, of a sandy soil, probably left by the sea, and more or less mixed with earth in proportion to the time they have remained uncovered by the waters; and such are found to prove the most favourable spots for raising the productions of other parts of the world. But these are partial and insufficient proofs of fertility. Every person who has attempted to make a garden of any kind near Fort Marlborough, must well know how ineffectual a labour it would prove, to turn up with the spade a piece of ground adopted at random. It becomes necessary for this purpose to form an artificial soil of dung, ashes, rubbish, and such other materials as can be procured. From these alone he can expect to raise the smallest supply of vegetables for the table. I have seen many extensive plantations of coconut, pinang, lime, and coffee-trees, laid out at a considerable expense by different gentlemen, and not one do I recollect to have succeeded; owing, as it would seem, to the barrenness of the soil, although covered with long grass. These disappointments have induced the Europeans almost entirely to neglect agriculture. The more industrious Chinese colonists, who work the ground with indefatigable pains, and lose no opportunity of saving and collecting manure, are rather more successful; yet have I heard one of the most able cultivators among this people, who, by the dint of labour and perseverence, had raised what then appeared to me a delightful garden, designed for profit as well as pleasure, declare that his heart was almost broken in struggling against nature; the soil being so ungrateful, that instead of obtaining an adequate return for his trouble and expense, the undertaking was likely to render him a bankrupt; and which he would inevitably have been, but for assistance afforded him by the East India Company.* The natives, it is true, without much or any

* Some particular plants, especially the tca, Key Sān used to tell me he considered as his children: his first care in the morning, and his last in the evening, was to tend and cherish them. I heard with concern of his death soon after the first publication of this work, and could have wished the old man had lived to know that the above small tribute of attention had been paid to his merits as a gardener.

In a letter received from the late ingenious Mr. Charles Campbell, belonging to the medical establishment of Fort Marlborough, whose communications I shall have future occasion
any cultivation raise several useful trees and plants; but they are in very small quantities, and immediately about their villages, where the ground is fertilized in spite of their indolence, by the common sweepings of their houses and streets and the mere vicinity of their buildings. I have often had occasion to observe, in young plantations, that those few trees which surrounded the house of the owner, or the hut of the keeper, considerably over-topped their brethren of the same age. Every person at first sight, and on a superficial view of the Malayan countries, pronounces them the favourites of nature, where she has lavished her bounties with a profusion unknown in other regions, and laments the infatuation of the people, who neglect to cultivate the finest soil in the world. But I have scarcely known one, who, after a few years' residence, has not entirely altered his opinion. Certain it is, that in point of external appearance they may challenge all others to comparison. In many parts of Sumatra, rarely trodden by human foot, scenes present themselves adapted to raise the sublimest sentiments in minds susceptible of the impression. But how rarely are they contemplated by minds of that temper! and yet it is alone

"For such the rivers dash their foaming tides,
The mountain swells, the vale subsides,
The stately wood detains the wand'ring sight,
And the rough barren rock grows pregnant with delight."

Even to notice, he writes on the 29th of March, 1802, "I must not omit to say a word about my attempts to cultivate the land. The result of all my labours in that way was disappointment, almost as heart-breaking as that of the unlucky Chinaman; whose example, however, did not deter me. After many vexations, I descended from the plains into the ravines, and there met with the success denied me on the elevated land. In one of these, through which runs a small rivulet emptying itself into the lake of Dusun Besar, I attempted a plantation of coffee, where there are now upwards of seven thousand plants firmly rooted and putting out new leaves." This cultivation has since been so much increased, as to become an important article of commerce.

It should at the same time be acknowledged, that our acquaintance with the central and eastern parts of the island is very imperfect, and that much fertile land may be found beyond the range of mountains.
SUMATRA.

Even where there are inhabitants, to how little purpose, as it respects them, has she been profuse in ornament! In passing through places where my fancy was charmed with more luxuriant, wild, and truly picturesque views than I had ever before met with, I could not avoid regretting, that a country so captivating to the eye should be allotted to a race of people who seem totally insensible of its beauties. But it is time to return from this excursion, and pursue the progress of the husbandman through his remaining labours.

Different nations have adopted various methods of separating the grain from the ear. The most ancient we read of was that of driving cattle over the sheaves, in order to trample it out. Large planks; blocks of marble; heavy carriages, have been employed in later times for this end. In most parts of Europe the flail is now in use, but in England begins to be superseded by the powerful and expeditious, but complicated threshing-machine. The Sumatrans have a mode differing from all these. The bunches of padi in the ear being spread on mats, they rub out the grain between and under their feet; supporting themselves, in common, for the more easy performance of this labour, by holding with their hands a bamboo placed horizontally over their heads. Although, by going always unshod, their feet are extremely callous, and therefore adapted to the exercise, yet the workmen when closely tasked by their masters, sometimes continue shuffling till the blood issues from their soles. This is the universal practice throughout the island.

After treading out, or threshing, the next process is to winnow the corn, (menği̱rei), which is done precisely in the same manner as practised by us. Advantage being taken of a windy day, it is poured out from a sieve or fan; the chaff dispersing, whilst the heavier grain falls to the ground. This simple mode seems to have been followed in all ages and countries, though now giving place, in countries where the saving of labour is a principal object, to mechanical contrivances.

In order to clear the grain from the husk, by which operation the padi acquires the name of rice (bras), and loses one half of its measured quantity, two bamboos of the former yielding only one of the latter, it is first spread
spread out in the sunshine to dry (*jumur*), and then pounded in large wooden mortars (*lesūng*), with heavy pestles (*alū*) made of a hard species of wood, until the outer coat is completely separated from it; when it is again fanned. This business falls principally to the lot of the females of the family, two of whom commonly work at the same mortar. In some places (but not frequently) it is facilitated by the use of a lever, to the end of which a short pestle or pounder is fixed; and in others by a machine which is a hollow cylinder or frustum of a cone, formed of heavy wood, placed upon a solid block of the same diameter, the contiguous surfaces of each being previously cut in notches or small grooves, and worked backwards and forwards, horizontally, by two handles or transverse arms; a spindle fixed in the centre of the lower cylinder serving as an axis to the upper or hollow one. Into this the grain is poured, and it is thus made to perform the office of the hopper, at the same time with that of the upper, or moveable stone, in our mills. In working, it is pressed downwards to increase the friction, which is sufficient to deprive the *padī* of its outer coating.

The rice is now in a state for sale, exportation, or laying up. To render it perfectly clean for eating, a point to which they are particularly attentive, it is put a second time into a *lesūng* of smaller size, and being sufficiently pounded without breaking the grains, it is again winnowed, by tossing it dexterously in a flat sieve, until the pure and spotless corns are separated from every particle of bran. They next wash it in cold water, and then proceed to boil it in the manner before described.

As an article of trade, the Sumatran rice seems to be of a more perishable nature than that of some other countries, the upland rice not being expected to keep longer than twelve months, and the low-land shewing signs of decay after six. At Natal there is a practice of putting a quantity of the leaves of a shrub called *lagundi* (*vitex trifolia*) amongst it, in granaries, or the holds of vessels, on the supposition of its possessing the property of destroying or preventing the generation of weevils that usually breed in it. In Bengal, it is said, the rice intended for exportation is steeped in hot water, whilst still in the husk, and afterwards dried by exposure
exposure to the sun; owing to which precaution, it will continue sound for two or three years, and is on that account imported for garrison store at the European settlements. If retained in the state of *padi*, it will keep very long without damaging.\(^a\) The country people lay it up unthreshed from the stalk, and beat it out (as we, render their word *tumbuk*) from time to time as wanted for use or sale.

The price of this necessary of life differs considerably throughout the island, not only from the circumstances of the season, but according to the general demand at the places where it is purchased, the degree of industry excited by such demand, and the aptitude of the country to supply it. The northern parts of the coast, under the influence of the Achinese, produce large quantities; particularly *Susu* and *Tampat-tián*, where it is (or used to be) purchased at the rate of thirty bamboos (gallons) for the Spanish dollar, and exported either to *Achín* or to the settlement of *Natal* for the use of the Residency of Fort Marlborough. At Natal also, and for the same ultimate destination, is collected the produce of the small island of *Nias*, whose industrious inhabitants, living themselves upon the sweet potatoe (*convolvulus batatas*) cultivate rice for exportation only, encouraged by the demand from the English and (what were) the Dutch factories. Not any is exported from Natal of its actual produce; a little from *Ayer Buñgi*; more from the extensive but neglected districts of *Pasaman* and *Masang*, and many cargoes from the country adjacent to Padang. Our pepper settlements to the northward of Fort Marlborough, from *Moco Moco* to *Laye* inclusive, export each a small quantity, but from thence southward to *Krói*, supplies are required for the subsistence of the inhabitants, the price varying from twelve to four bamboos, according to the season. At our head settlement the consumption of the civil and military establishments, the Company’s labourers, together with the Chinese and Malayan settlers, so much exceeds the produce of the adjoining districts (although exempted from any obligation to cultivate pepper) that there is a necessity for importing a quantity from

---

\(^a\) I have in my possession specimens of a variety of species which were transmitted to me twelve years ago, and are still perfectly sound.
SUMATRA.

from the islands of Java and Bally, and from Bengal, about three to six thousand bags annually.

The rice called pūlut or bras se-pūlut (oryza gelatinosa) of which mention has been made in the list (p. 66) is in its substance of a very peculiar nature, and not used as common food, but with the addition of coconut kernel, in making a viscous preparation called lemang which I have seen boiled in a green bamboo, and other juādahs or friandises. It is commonly distinguished into the white, red, and black sorts, among which the red appears to be the most esteemed. The black chiefly is employed by the Chinese colonists at Batavia and Fort Marlborough in the composition of a fermented liquor called bram or brum, of which the basis is the juice extracted from a species of palm.

The Coconut tree, kalāpa, niōr (cocos nucifera) may be esteemed the next important object of cultivation, from the uses to which its produce is applied; although by the natives of Sumatra it is not converted to such a variety of purposes as in the Maldives and those countries where nature has been less bountiful in other gifts. Its value consists principally in the kernel of the nut, the consumption of which is very great, being an essential ingredient in the generality of their dishes. From this also, but in a state of more maturity, is procured the oil in common use near the sea-coast, both for anointing the hair, in cookery, and for burning in lamps. In the interior country other vegetable oils are employed, and light is supplied by a kind of links made of dammar or resin. A liquor, commonly known in India by the name of toddy, is extracted from this as well as from other trees of the palm-kind. Whilst quite fresh it is sweet and pleasant to the taste, and is called nīra. After four and twenty hours it acidulates, ferments, and becomes intoxicating, in which state it is called tūak. Being distilled with molasses and other ingredients, it yields the spirit called arrack. In addition to these, but of trifling importance, are the cabbage or succulent pith at the head of the tree,

* This has reference to the period between 1770 and 1780, generally. So far as respects the natives there has been no material alteration.
SUMATRA.

tree, which, however, can be obtained only when it is cut down, and the fibres of the leaves, of which the natives form their brooms. The stem is never used for building, nor any carpenter's purposes, in a country where fine timber so much abounds. The fibrous substance of the husk is not there manufactured into cordage, as in the west of India, where it is known by the name of coir; rattans and ējū (a substance to be hereafter described), being employed for that purpose. The shell of the nut is but little employed as a domestic utensil, the lower class of people preferring the bamboo and the labu (cucurbita lagenaria); and the better sort being possessed of coarse china-ware. If the filaments surrounding the stem are any where manufactured into cloth, as has been asserted, it must be in countries that do not produce cotton, which is a material beyond all comparison preferable: besides that certain kind of trees, as before observed, afford, in their soft and pliable inner bark, what may be considered as a species of cloth ready woven to their hands.

This tree, in all its species, stages, fructification, and appropriate uses, has been so elaborately and justly described by many writers, especially the celebrated Rumphius, in his Herbarium Amboinense, and Van Rheede, in his Hortus Malabaricus, that to attempt it here would be an unnecessary repetition, and I shall only add a few local observations on its growth. Every dusun is surrounded with a number of fruit-bearing trees, and especially the coconut, where the soil and temperature will allow them to grow, and near the bazars or sea-port towns, where the concourse of inhabitants is in general much greater than in the country, there are always large plantations of them, to supply the extraordinary demand. The tree thrives best in a low, sandy soil, near the sea, where it will produce fruit in four or five years; whilst in the clayey ground it seldom bears in less than seven to ten years. As you recede from the coast the growth is proportionally slower, owing to the greater degree of cold among the hills; and it must attain there nearly its full height before it is productive, whereas in the plains a child can generally reach its first fruit from the ground. Here, said a countryman at Laye, if I plant a coconut, or durian tree, I may expect to reap the fruit of it; but in Labun (an inland district) I should only plant for
my great-grandchildren. In some parts, where the land is particularly high, neither these, the betelnut, nor pepper-vines, will produce fruit at all.

It has been remarked by some writer, that the great date-bearing palm-tree, and the coconut, are never found to flourish in the same country. However this may hold good as a general assertion, it is a fact that not one tree of that species is known to grow in Sumatra, where the latter, and many others of the palm kind, so much abound. All the small low islands which lie off the western coast are skirted, near the sea-beach, so thickly with coconut trees, that their branches touch each other, whilst the interior parts, though not on a higher level, are entirely free from them. This, beyond a doubt, is occasioned by the accidental floating of the nuts to the shore, where they are planted by the hand of nature, shoot up, and bear fruit; which, falling when it arrives at maturity, causes a successive reproduction. Where uninhabited, as is the case with Pulo Mego, one of the southernmost, the nuts become a prey to the rats and squirrels; unless when occasionally disturbed by the crews of vessels, which go thither to collect cargoes for market on the main-land. In the same manner, as we are told by Flacourt,® they have been thrown upon the coast of Madagascar, and are not there indigenous; as I have been also assured by a native. Yet it appears that the natives call it voaniou, which is precisely the name by which it is familiarly known in Sumatra, being būah-niōr; the v being uniformly substituted for b, and f for p, in the numerous Malayan words occurring in the language of the former island. On the other hand, the singular production to which the appellation of sea-coconut (kalāpa lāut) has been given, and which is known to be the fruit of a species of borassus growing in one of the Séchelles Islands,¹ not far from Madagascar, are sometimes floated as far as the Malayan coasts, where they are supposed to be natives of the ocean, and were held in high ve-

---

* Histoire de l'île Madagascar, p. 127.

¹ See a particular description of the sea-coconut, with plates, in the Voyage à la Nouvelle Guinée, par Sonnerat, p. 3.
neration for their miraculous effects in medicine, until about the year 1772 a large cargo of them was brought to Bencoolen by a French vessel, when their character soon fell with their price.

The *pinang* (areca catechu L.) or betel-nut tree (as it is usually, but improperly, called, the betel being a different plant) is in its mode of growth and appearance not unlike the coconut. It is, however, straighter in the stem, smaller in proportion to the height, and more graceful. The fruit, of which the varieties are numerous, (such as the *pinang betul*, *pinang ambun*, and *pinang vanigi*) is, in its outer-coat, about the size of a plum; the nut, something less than that of the nutmeg, but rounder. This is eaten with the leaf of the *sirih* or betel (piper betel L.) a climbing plant, whose leaf has a strong aromatic flavour, and other stimulating additions; a practice that shall be hereafter described. Of both of these the natives make large plantations.

In respect to its numerous and valuable uses, the *bambu* or bamboo-cane (arundo bambos) holds a conspicuous rank amongst the vegetables of the island, though I am not aware that it is any where cultivated for domestic purposes, growing wild, in most parts, in great abundance. In the Batta country, and perhaps some other inland districts, they plant a particular species very thickly about their *kampongs* or fortified villages, as a defence against the attacks of an enemy; the mass of hedge which they form being almost impenetrable. It grows in common to the thickness of a man’s leg, and some sorts to that of the thigh. The joints are from fifteen to twenty inches asunder, and the length about twenty to forty feet. In all manner of building it is the chief material, both in its whole state, and split into laths and otherwise, as has already appeared in treating of the houses of the natives; and the various other modes of employing it will be noticed either directly or incidentally in the course of the work.

The sugar-cane (*tubbu*) is very generally cultivated, but not in large quantities, and more frequently for the sake of chewing the juicy reed, which they consider as a delicacy, than for the manufacture of sugar. Yet this is not unattended to, for home consumption, especially in the northern
northern districts. By the Europeans and Chinese large plantations have been set on foot near Bencoolen, and worked from time to time with more or less effect; but in no degree to rival those of the Dutch at Batavia, from whence, in time of peace, the exportation of sugar (gula), sugar-candy (gula batu) and arrack, is very considerable. In the southern parts of the island, and particularly in the district of Manna, every village is provided with two or three machines, of a peculiar construction, for squeezing the cane; but the inhabitants are content with boiling the juice to a kind of sirop. In the Lampong country they manufacture from the liquor yielded by a species of palm-tree, a moist, clammy, imperfect kind of sugar, called jaggri in most parts of India.*

This palm, named in Sumatra anau, and by the eastern Malays gomuto, is the borassus gomutus of Loureiro, the saguerus pinnatus of the Batavian Transact. and the cleophora of Gaertner. Its leaves are long and narrow, and though naturally tending to a point, are scarcely ever found perfect, but always jagged at the end. The fruit grows in bunches of thirty or forty together, on strings three or four feet long, several of which hang from one shoot. In order to procure the nira or toddy (held in higher estimation than that from the coconut-tree), one of these shoots for fructification is cut off a few inches from the stem, the remaining part is tied up and beaten, and an incision is then made, from which the liquor distils into a vessel or bamboo closely fastened beneath. This is replaced every twenty-four hours. The anau palm produces also (beside a little sago) the remarkable substance called ẖū and gomuto, exactly resembling coarse black horse-hair, and used for making cordage of a very excellent kind, as well as for many other purposes, being nearly incorruptible. It encompasses the stem of the tree, and is seemingly bound to it by thicker fibres or twigs, of which the natives make pens for writing. Toddy is likewise procured from the lontar or borassus flabellifer, the tula of the Hindus.

The Rambiya, pūhn sagu, or proper sago tree, is also of the palm kind. Its

* This word is evidently the shakar of the Persians, the Latin saccharum, and our sugar.
Its trunk contains a farinaceous and glutinous pith, that being soaked, dried, and granulated, becomes the sago of our shops, and has been too frequently and accurately described (by Rumphius, in particular, Vol. I. ch. 17 and 18, and by M. Poivre) to need a repetition here.

The nibong (caryota urens), another species of palm, grows wild in such abundance, as not to need cultivation. The stem is tall, slender, and straight, and being of a hard texture on the outer part, it is much used for posts in building the slight houses of the country, as well as for paling of a stronger kind than the bamboo usually employed. Within side it is fibrous and soft, and when hollowed out, being of the nature of a pipe, is well adapted to the purpose of gutters or channels to convey water. The cabbage, as it is termed, or pith at the head of the tree (the germ of the foliage) is eaten as a delicacy, and preferred to that of the coconut.

The nipah, (cocos nypa, Lour.) a low species of palm, is chiefly valuable for its leaves, which are much used as thatch for the roofs of houses. The pulpy kernels of the fruit (called buah alap) are preserved as a sweetmeat, but are entirely without flavour.

The pâku bindu (cycas circinalis) has the general appearance of a young, or rather dwarf coconut-tree, and like that and the nibong produces a cabbage that is much esteemed as a culinary vegetable. The tender shoots are likewise eaten. The stem is short and knobby, the lower part of each branch (if branches they may be called) prickly, and the blossom yellow. The term pâku, applied to it by the Malays, shews that they consider it as partaking of the nature of the fern (filix), and Rumphius, who names it savor calappa and olus calappoides, describes it as an arborescent species of osmunda. It is well depicted in Vol. I. tab. 22.

The maiz or Turkey-corn (zea mays), called jagong, though very generally sown, is not cultivated in quantities as an article of food, excepting in the Batta country. The ears are plucked whilst green, and, being slightly roasted on the embers, are eaten as a delicacy. Chili or Cayenne
Cayenne pepper (capsicum), called improperly lāda panjang or long pepper, and also lāda mērah, red pepper, which, in preference to the common or black pepper, is used in their curries and with almost every article of their food, always finds a place in their irregular and inartificial gardens. To these, indeed, their attention is very little directed, in consequence of the liberality with which nature, unsolicited, supplies their wants. Turmeric (curcuma) is a root of general use. Of this there are two kinds, the one called kūnyit mērah, an indispensable ingredient in their curries, pilaws, and sundry dishes; the other, kūnyit tummu (a variety with coloured leaves, and a black streak running along the mid-rib) is esteemed a good yellow dye, and is sometimes employed in medicine. Ginger (amomum zinziber) is planted in small quantities. Of this, also, there are two kinds, a'liu jāi (zinziber majus), and a'liu padas (zinziber minus), familiarly called se-padē or se-puddē, from a word signifying that pungent, acrid, taste in spices, which we express by the vague term “hot.” The tummu (costus arabicus), and lampuyang (amomum zerumbet), are found both in the wild and cultivated state, being used medicinally; as is also the galangale (kämpferia galanga). The coriander, called katumbār, and the cardamum, pūah lako, grow in abundance. Of the pūah (amomum) they reckon many species, the most common of which has very large leaves, resembling those of the plantain and possessing an aromatic flavour not unlike that of the bay tree. The jintan or cumin-seed (cuminum) is sometimes an ingredient in curries. Of the Mōrānīggei or kelor (guilandina moringa L. hyperanthera moringa Wilden.), a tall shrub with pinnated leaves, the root has the appearance, flavour, and pungency of the horse-radish, and the long pods are dressed as a culinary vegetable; as are also the young shoots of the priūggi (cucurbita pepo), various sorts of the tapang or cucumber, and of the lobak or radish. The īnci or henna of the Arabians (lawsonia inermis) is a shrub with small light-green leaves, yielding an expressed juice, with which the natives tinge the nails of their hands and feet. Ampalas (delima sarmentosa and ficus ampeles) is a shrub whose blossom resembles that of our hawthorn in appearance and smell. Its leaf has an extraordinary roughness, on which account it is employed to give the ast fine polish to carvings in wood and ivory, particularly the handles and sheaths of their krises, on which they bestow much labour. The leaf
The Kaluwi is a species of urtica or nettle, of which excellent twine, called pulas, is made. It grows to the height of about four feet, has a stem imperfectly ligneous, without branches. When cut down, dried, and beaten, the rind is stripped off, and then twisted as we do the hemp. It affords me great satisfaction to learn that the manufacture of rope from this useful plant has lately attracted the attention of the Company’s Government, and that a considerable nursery of the kaluwi has been established in the Botanic Garden at Calcutta, under the zealous and active management of Dr. Roxburgh, who expresses his opinion, that so soon as a method shall be discovered of removing a viscid matter found to adhere to the fibres, the kaluwi hemp, or pulas, will supersede every other material. The bagu tree (Gnetum gnemon, L.) abounds on the southern coast of the island, where its bark is beaten, like hemp, and the twine manufactured from it is employed in the construction of large fishing nets. The young leaves of the tree are dressed in curries. In the island of Nias they make a twine of the baru tree (Hibiscus tiliaceus), which is afterwards woven into a coarse cloth for bags. From the pisang (musa) a kind of sewing-thread is procured by stripping filaments from the mid-ribs of the leaves as well as from the stem. In some places this thread is worked in the loom. The kratou, a dwarf species of mulberry (Morus, foliis profunde incisis) is planted for the food of the silk-worms, which they rear, but not to any great extent, and the raw silk produced from them seems of but an indifferent quality. The samples I have seen were
were white instead of yellow, in large, flat cakes, which would require much trouble to wind off, and the filaments appeared coarse; but this may be partly occasioned by the method of loosening them from the bags, which is by steeping them in hot water. Jārak (ricinus and palma christi) from whence the castor oil is extracted, grows wild in abundance, especially near the sea-shore. Bijin (sesamum indicum) is sown extensively in the interior districts, for the oil it produces, which is there used for burning, in place of the coconut-oil so common near the coast.

Elastic gum: In the description of the urceola elastica, or caout-chouc vine, of Sumatra and Pulo-Pinang, by Dr. W. Roxburgh, in the Asiatic Res. Vol. V. p. 167, he says, “For the discovery of this useful vine, we are, I believe, indebted to Mr. Howison, late surgeon at P. Pinang; but it would appear he had no opportunity of determining its botanical character. To Dr. Charles Campbell, of Fort Marlborough, we owe the gratification arising from a knowledge thereof. About twelve months ago I received from that gentleman, by means of Mr. Fleming, very complete specimens, in full foliage, flower, and fruit. From these I was enabled to reduce it to its class and order in the Linnæan system. It forms a new genus immediately after tabernæmontana, and consequently belongs to the class called contortæ. One of the qualities of the plants of this order is, their yielding, on being cut, a juice which is generally milky, and for the most part deemed of a poisonous nature.” Of another plant, producing a similar substance, I received the following information from Mr. Campbell, in a letter dated in November, 1803: “You may remember a trailing plant with a small yellowish flower, and a seed vessel of an oblong form, containing one seed; the whole plant resembling much the caout-chouc. To this, finding it wholly non-descript, I have taken the liberty to attach your name. It has no relationship to a genus yielding a similar substance, of which I sent a specimen to Dr. Roxburgh at Bengal, who published an account of it under the name of urceola. It is called jīntan by the Malays, and of its three species I have accurately ascertained two, the jīntan itam and jīntan burong, the latter very rare. Its leaves are of a deep glossy green, and the flowers lightly tinged with a pale yellow; it belongs to the tetrandria, and is a handsome plant—but more of this with the drawing.” Unfortunately, however,
however, neither this drawing, nor any part of his valuable collection of materials for improving the natural history of that interesting country, which he bequeathed to me by his will, have yet reached my hands.

Mr. Charles Miller observed in the country, near Bencoolen, a gum exuding spontaneously from the paty tree, which appeared very much to resemble the gum-arabic; and as they belong to the same genus of plants, he thought it not improbable that this gum might be used for the same purposes. In the list of new species by F. Norona (Batav. Trans. Vol. V.) he gives to the petè of Java the name of acacia gigantea; which I presume to be the same plant.

_Kachang_ is a term applied to all sorts of pulse, of which a great variety is cultivated; as the _kachang chîna_ (dolichos sinensis), _kachang putih_ (dolichos katjang), _k. ka-karah_ (d. lignosus), _k. kechil_ (phaseolus radiatus), _k. ka-karah gatal_ (dolichos pruriens) and many others. The _kachang tanah_ (arachis hypogæa) is of a different class, being the granulose roots (or, according to some, the self-buried pods) of an herb with a yellow, papilionaceous flower, the leaves of which have some resemblance to the clover, but double only, and like it, affords rice pasture for cattle. The seeds are always eaten fried or parched, from whence they obtain their common appellation of _kachang goring_.

The variety of roots of the yam and potatoe kind, under the general name of ūbi, is almost endless; the dioscorea being generally termed ūbi _kechil_ (small), and the convolvulus, ūbi _gadâng_ (large); some of which latter, of the sort called at Bencoolen the China yam, weigh as much as forty pounds, and are distinguished into the white and the purple. The fruit of the _trong_ (melongena), of which the egg-plant is one species, is much eaten by the natives, split and fried. They are commonly known by the name of _brinjals_, from the _beringélhas_ of the Portuguese.

_Târüm_ or indigo (indigofera tinctoria) being the principal dye-stuff they employ, the shrub is always found in their planted spots; but they do not manufacture it into a solid substance, as is the practice elsewhere. The stalks and branches having lain for some days in water to soak and macerate,
macerate, they then boil it, and work among it with their hands a small quantity of *chunam* (quick lime, from shells), with leaves of the *paku sabba* (*a* species of fern) for fixing the colour. *It is afterwards drained off,* and made use of in the liquid state.

There is another kind of indigo, called in Sumatra *tārūm akar,* which appears to be peculiar to that country, and was totally unknown to botanists to whom I shewed the leaves upon my return to England in the beginning of the year 1780. The common kind is known to have small pinnated leaves growing on stalks imperfectly ligneous. This, on the contrary, is a vine, or climbing plant, with leaves from three to five inches in length, thin, of a dark green, and in the dried state discoloured with blue stains. It yields the same dye as the former sort; they are prepared also in the same manner, and used indiscriminately, no preference being given to the one above the other, as the natives informed me; excepting inasmuch as the *tārūm akar,* by reason of the largeness of the foliage, yields a greater proportion of sediment. Conceiving it might prove a valuable plant in our colonies, and that it was of importance in the first instance that its identity and class should be accurately ascertained, I procured specimens of its fructification, and deposited them in the rich and extensively useful collection of my friend Sir Joseph Banks. In a paper on the Asclepiadaceae, highly interesting to botanical science, communicated by Mr. Robert Brown (who has lately explored the vegetable productions of New Holland and other parts of the East) to the Wernerian Society of Edinburgh, and printed in their Transactions, he has done me the honour of naming the genus to which this plant belongs, Marsdenia, and this particular species Marsdenia tinctoria.®

Under the name of *kasumba* are included two plants yielding materials for dying, but very different from each other. The *kasumba* (*simply*) or *kasumba*®

SUMATRA.

*Kasumba jawa,* as it is sometimes called, is the *carthamus tinctorius,* of which the flowers are used to produce a saffron colour, as the name imports. The *kasumba kling* or *galunga* is the *bixa orellana,* or arnotto of the West Indies. Of this the capsule, about an inch in length, is covered with soft prickles or hair, opens like a bivalve shell, and contains in its cavities a dozen or more seeds, the size of grape-stones, thickly covered with a reddish farina, which is the part that constitutes the dye.

*Sapang,* the Brazil-wood, (*caesalpinia sappan*), whether indigenous or not, is common in the Malayan countries. The heart of this being cut into chips, steeped for a considerable time in water, and then boiled, is used for dying here, as in other countries. The cloth or thread is repeatedly dipped in this liquid, and hung to dry between each wetting, till it is brought to the shade required. To fix the colour, alum is added in the boiling.

Of the tree called *banigküdu* in some districts, and in others *manigküdu* (*morinda umbellata*) the outward parts of the root, being dried, pounded, and boiled in water, afford a red dye; for fixing which, the ashes procured from the stalks of the fruit and midribs of the leaves of the coconut are employed. Sometimes the bark or wood of the *sapang* tree is mixed with these roots. It is to be observed that another species of *banigküdu,* with broader leaves (*morinda citrifolia*) does not yield any colouring matter; but is, as I apprehend, the tree commonly planted in the Malayan peninsula and in *Pulo Pinang,* as a support to the pepper vine.

*Ubar* is a red wood resembling the logwood (*haematoxylon*) of Honduras, and might probably be employed for the same purpose. It is used by the natives in tanning twine for fishing nets, and appears to be the *okir* or tanarius major of Rumph. Vol. III. p. 192. and jambolifera rezinoso of Lour. Fl. C. C. p. 231. Their black dye is commonly made from the coats of the mangostin fruit and of the *kataping* (*terminalia catappa*). With this the blue cloth from the west of India is changed to a black, as usually worn by the Malays of *Menaŋkabau.* It is said to be steeped in mud in order to fix the colour.

The
The roots of the *chapada* or *champadak* (*artocarpus integrifolia*) cut into chips and boiled in water produce a yellow dye. To strengthen the tint, a little turmeric (*kūnyit tumma* or variety of *curcuma* already spoken of) is mixed with it, and alum to fix it; but as the yellow does not hold well, it is necessary that the operation of steeping and drying should be frequently repeated.

*Fruits,*
NATURE, says a celebrated writer,\(^a\) seems to have taken a pleasure in assembling in the Malayan countries her most favourite productions; and with truth I think it may be affirmed, that no region of the earth can boast an equal abundance and variety of indigenous fruits; for although the whole of those hereafter enumerated cannot be considered as such, yet there is reason to conclude that the greater part may; for the natives, who never appear to bestow the smallest labour in improving or even in cultivating such as they naturally possess, can hardly be suspected of taking the pains to import exotics. The larger number grow wild, and the rest are planted in a careless, irregular manner about their villages.

The mangustin, called by the natives marīgis and marīgista (garśinia mangostana, L.) is the pride of these countries, to which it exclusively belongs, and has, by general consent, obtained, in the opinion of Europeans, the pre-eminence amongst Indian fruits. Its characteristic quality is extreme delicacy of flavour, without being rich or luscious. It is a drupe of a brownish red colour, and the size of a common apple, consisting of a thick rind, somewhat hard on the outside, but soft and succulent within, encompassing kernels which are covered with a juicy

\(^a\) "Les terres possédées par les Malais, sont en général de très-bonne qualité. La nature semble avoir pris plaisir d’y placer ses plus excellentes productions. On y voit tous les fruits délicieux que j’ai dit se trouver sur le territoire de Siam, et une multitude d’autres fruits agréables qui sont particuliers à ces iles.” "On y respire un air embaumé par une multitude de fleurs agréables qui se succèdent toute l’année, et dont l’odeur suave pénètre jusqu’à l’ame, et inspire la volupté la plus seduisante. Il n’est point de voyageur qui en se promenant dans les campagnes de Malacca, ne se sente invité à fixer son séjour dans un lieu si plein d’agrémens, dont la nature seule à fait tous les frais.”

Voyages d’un Philosophe, par M. Poivre, p. 56.
SUMATRA.

and perfectly white pulp, which is the part eaten, or, more properly, sucked, for it dissolves in the mouth. Its qualities are as innocent as they are grateful, and the fruit may be eaten in any moderate quantity without danger of surfeit, or other injurious effects. The returns of its season appeared to be irregular, and the periods short.

Durian. The durian (durio zibethinus) is also peculiar to the Malayan countries. It is a rich fruit, but strong, and even offensive, in taste as well as smell, to those who are not accustomed to it, and of a very heating quality; yet the natives (and others who fall into their habits) are passionately addicted to it, and during the time of its continuing in season live almost wholly upon its luscious and cream-like pulp; whilst the rinds, thrown about in the bazars, communicate their scent to the surrounding atmosphere. The tree is large and lofty; the leaves are small in proportion, but in themselves long and pointed. The blossoms grow in clusters on the stem and larger branches. The petals are five, of a yellowish white, surrounding five branches of stamina, each bunch containing about twelve, and each stamen having four antheræ. The pointal is knobbed at top. When the stamina and petal fall, the empalement resembles a fungus, and nearly in shape, a Scot’s bonnet. The fruit is in its general appearance not unlike the bread-fruit, but larger, and its coat is rougher.

Bread-fruit. The sukan kapas, and sukn biji or kalawi, are two species of the bread-fruit tree (artocarpus incisa). The former is the genuine, edible kind, without kernels, and propagated by cuttings of the roots. Though by no means uncommon, it is said not to be properly a native of Sumatra. The kalawi, on the contrary, is in great abundance, and its bark supplies the country people with a sort of cloth for their working dresses. The leaves of both species are deeply indented, like those of the fig, but considerably longer. The bread-fruit is cut in slices, and, being boiled or broiled on the fire, is eaten with sugar, and much esteemed. It cannot, however, be considered as an article of food, and I suspect that in quality it is inferior to the bread-fruit of the South-Sea Islands.

Jack-fruit. The Malabaric name of jacca, or the jack-fruit, is applied both to
the champadak or chapada (artocarpus integrifolia, L. and polyphema jaca, Lour.) and to the nangka (artocarpus integrifolia, L. and polyphema cham peden, Lour). Of the former the leaves are smooth and pointed; of the latter they are roundish, resembling those of the Cashew. This is the more common, less esteemed, and larger fruit, weighing, in some instances, fifty or sixty pounds. Both grow in a peculiar manner from the stem of the tree. The outer coat is rough, containing a number of seeds or kernels (which, when roasted, have the taste of chesnuts) inclosed in a fleshy substance, of a rich, and to strangers too strong smell and flavour, but which gains upon the palate. When the fruit ripens, the natives cover it with mats, or the like, to preserve it from injury by the birds. Of the viscous juice of this tree they make a kind of bird-lime: the yellow wood is employed for various purposes, and the root yields a dye-stuff.

The mango, called maniga and mampalam (mangifera indica, L.) is well known to be a rich, high-flavoured fruit of the plumb kind, and is found here in great perfection; but there are many inferior varieties, beside the ambachang, or mangifera foetida, and the tais.

Of the jambu (eugenia, L.) there are several species, among which the jambu merah or kling (eug. malaccensis) is the most esteemed for the table, and is also the largest. In shape it has some resemblance to the pear, but is not so taper near the stalk. The outer skin, which is very fine, is tinged with a deep and beautiful red, the inside being perfectly white. Nearly the whole substance is edible, and when properly ripe it is a delicious fruit; but otherwise, it is spongy and indigestible. In smell, and even in taste, it partakes much of the flavour of the rose; but this quality belongs more especially to another species, called jambu ayer mawar, or the rose-water jambu. Nothing can be more beautiful than the blossoms, the long and numerous stamina of which are of a bright pink colour. The tree grows in a handsome, regular, conical shape, and has large, deep-green, pointed leaves. The jambu ayer (eugenia aqua) is a delicate and beautiful fruit in appearance, the colour being a mixture of white and pink; but in its flavour, which is a faint, agreeable acid, it does not equal the jambu merah.
Of the *pisang*, or plantain (*musa paradisiaca*, L.) the natives reckon above twenty varieties, including the banana of the West Indies. Among these the *pisang amas*, or small yellow plantain, is esteemed the most delicate; and next to that the *pisang raja*, *pisang dingen*, and *pisang kalé*.

The *nanas*, or pine-apple (*bromelia ananas*), though certainly not indigenous, grows here in great plenty with the most ordinary culture. Some think them inferior to those produced from hot-houses in England; but this opinion may be influenced by the smallness of their price, which does not exceed two or three pence. With equal attention, it is probable, they might be rendered much superior, and their variety is considerable. The natives eat them with salt.

Oranges (*limau manis*) of many sorts, are in the highest perfection. That called *limau japun*, or Japan orange, is a fine fruit, not commonly known in Europe. In this the cloves adhere but slightly to each other, and scarcely at all to the rind, which contains an unusual quantity of the essential oil. The *limau gadang*, or pulple-nose (*citrus aurantium*), called in the West Indies the shaddock (from the name of the captain who carried them thither), is here very fine, and distinguished into the white and red sorts. Limes or *limau kapas*, and lemons, *limau kapas panjang*, are in abundance. The natives enumerate also the *limau larigga*, *limau kambing*, *limau pīpit*, *limau sindi masam*, and *limau sindi manis*. The true citron, or *limau karbau*, is not common, nor in esteem.

The guava (*psidium pomeriferum*) called *jambu biji*, and also *jambu protukal* (for Portugal, in consequence, as we may presume, of its having been introduced by the people of that country) has a flavour which some admire, and others equally dislike. The pulp of the red sort is sometimes mixed with cream by Europeans, to imitate strawberries, from a fond partiality to the productions of their native soil; and it is not unusual, amidst a profusion of the richest eastern fruits, to sigh for an English codling or gooseberry.

The *siri kaya*, or custard-apple (*annona squamosa*), derives its name from
from the likeness which its white and rich pulp bears to a custard, and it is accordingly eaten with a spoon. The nona, as it is called by the natives (annona reticulata), is another species of the same fruit, but not so grateful to the taste.

The kaliki, or papaw (carica papaja), is a large, substantial, and wholesome fruit, in appearance not unlike a smooth sort of melon, but not very highly flavoured. The pulp is of a reddish yellow, and the seeds, which are about the size of grains of pepper, have a hot taste like cresses. The water-melon, called here samangka (cucurbita citrullus) is of very fine quality. The rock, or musk melons, are not common.

Tamarinds, called asam jawa, or the Javan acid, are the produce of a large and noble tree, with small pinnated leaves, and supply a grateful relief in fevers, which too frequently require it. The natives preserve them with salt, and use them as an acid ingredient in their curries and other dishes. It may be remarked, that in general they are not fond of sweets, and prefer many of their fruits whilst green, to the same in their ripe state.

The rambutan (nephelium lappaceum, L. Mant.) is in appearance not much unlike the fruit of the arbutus, but larger, of a brighter red, and covered with coarser hair or soft spines, from whence it derives its name. The part eaten is a gelatinous and almost transparent pulp surrounding the kernel, of a rich and pleasant acid.

The lanseh, likewise but little known to botanists, is a small, oval fruit, of a whitish brown colour, which, being deprived of its thin outer coat, divides into five cloves, of which the kernels are covered with a fleshy pulp, subacid, and agreeable to the taste. The skin contains a clammy juice, extremely bitter, and, if not stripped with care, it is apt to communicate its quality to the pulp. M. Corréa de Serra, in les Annales du Mus. d' Hist. Nat. Tom. X. p. 157. pl. 7. has given a description of the lansium domesticum, from specimens of the fruit preserved in the collection of Sir Joseph Banks. The chupak, ayer-ayer, and rambé are species or varieties of the same fruit.
Of the blimbing (averrhoa carambola) a pentagonal fruit, containing five flattish seeds, and extremely acid, there are two sorts, called penjuru and besi. The leaves of the latter are small, opposite, and of a sap-green; those of the former grow promiscuously, and are of a silver green. There is also the blimbing bulu (averrhoa billimbi), or smooth species. Their uses are chiefly in cookery, and for purposes where a strong acid is required, as in cleaning the blades of their krises and bringing out the damask, for which they are so much admired. The cheremi (averrhoa acida) is nearly allied to the blimbing besi, but the fruit is smaller, of an irregular shape, growing in clusters close to the branch, and containing each a single hard seed or stone. It is a common substitute for our acid fruits in tarts.

The kataping (terminalia catappa, L. and juglans catappa, Lour.) resembles the almond both in its outer husk and the flavour of its kernel; but instead of separating into two parts, like the almond, it is formed of spiral folds, and is developed somewhat like a rose-bud, but continuous, and not in distinct laminae.

The baranğan (a species of fagus) resembles the chestnut. The tree is large, and the nuts grow sometimes one, two, and three in a husk. The jerring, a species of mimosa, resembles the same fruit, but is larger and more irregularly shaped than the baranğan. The tree is smaller. The tapus (said to be a new genus belonging to the tricoccae) has likewise some analogy, but more distant, to the chestnut. There are likewise three nuts in one husk, forming in shape an oblong spheroid. If eaten unboiled, they are said to inebriate. The tree is large.

The fruit named kamiri, kamiling, and more commonly buah kras, or the hard fruit (camirium cordifolium, Gärt. and juglans camirium, Lour.) bears much resemblance to the walnut in the flavour and consistence of the kernel; but the shell is harder, and does not open in the same manner. The natives of the hills make use of it as a substitute for the coconut, both in their cookery, and for procuring a delicate oil.

The rotan salak (calamus zalacca, Gärt.) yields a fruit, the pulp of which
SUMATRA.

which is sweetish, acidulous, and pleasant. Its outer coat, like those of the other *rotans*, is covered with scales, or the appearance of nice basket-work. It incloses sometimes one, two, and three kernels, of a peculiar horny substance.

The cashew-apple and nut, called *jambu muniet*, or monkey-jambu (ananarum occidentale), are well known for the strong acidity of the former, and the caustic quality of the oil contained in the latter, from tasting which the inexperienced often suffer.

The pomegranate or *dalima* (punica granatum) flourishes here, as in all warm climates.

Grape-vines are planted with success by Europeans for their tables, but not cultivated by the people of the country. There is found in the woods a species of wild grape, called *prinagat* (vitis indica); and also a strawberry, the blossom of which is yellow, and the fruit has little flavour. Beside these there are many other, for the most part wild fruits, of which some boast a fine flavour, and others are little superior to our common berries, but might be improved by culture. Such are the *buah kandis*, a variety of *garcinia* (it should be observed that *buah*, signifying fruit, is always prefixed to the particular name), *buah malaka* (phyllanthus emblica), *rukam* (carissa spinarum), *baŋkudu* or *marŋkudu* (morinda citrifolia), *sikaduduk* (melastoma), *kitapan* (callicarpa japonica).

"You breathe in the country of the Malays (says the writer before quoted) an air impregnated with the odours of innumerable flowers of the greatest fragrance, of which there is a perpetual succession throughout the year, the sweet flavour of which captivates the soul, and inspires the most voluptuous sensations." Although this luxurious picture may be drawn in too warm tints, it is not, however, without its degree of justness. The people of the country are fond of flowers in the ornament of their persons, and encourage their growth, as well as that of various odoriferous shrubs and trees.

The *kananga* (uvaria cananga, L.) being a tree of the largest size, sur-
passed by few in the forest, may well take the lead, on that account, in a description of those which bear flowers. These are of a greenish yellow, scarcely distinguishable from the leaves, among which the bunches hang down in a peculiar manner. About sun-set, if the evening be calm, they diffuse a fragrance around that affects the sense at the distance of some hundred yards.

**Champaka.**  *Champaka* (michelia champaca). This tree grows in a regular, conical shape, and is ornamental in gardens. The flowers are a kind of small tulip, but close and pointed at top; their colour a deep yellow; the scent strong, and at a distance agreeable. They are wrapped in the folds of the hair, both by the women, and by young men who aim at gallantry.

**Tanjong.**  *Buñiga tanjong* (mimusops elengi, L.) A fair tree, rich in foliage, of a dark green; the flowers small, radiated, of a yellowish white, and worn in wreaths by the women; their scent, though exquisite at a distance, is too powerful when brought nigh. The fruit is a drupe, containing a large, blackish, flattened seed.

**Gardenia.**  *Saṅgklapa* (gardenia flore simplice). A handsome shrub with leaves of very deep green, long-pointed; the flowers a pure white, without visible stamina or pistil, the petals standing angularly to each other. It has little or no scent. The *pachah-piring* (gardenia florida, described by Rumph. under the name of *catsjopiri*) is a grand, white, double flower, emitting a pleasing and not powerful odour.

**Hibiscus.** The *buñiga rāya* (hibiscus rosa sinensis) is a well-known shrub, with leaves of a yellowish green, serrated and curled. Of one sort the flower is red, yielding a juice of deep purple, and when applied to leather produces a bright black; from whence its vulgar name of the shoe-flower. Of another sort the blossom is white. They are without smell.

**Plumeria.**  *Buñiga or kumbang kamboja* (plumeria obtusa) is likewise named *buñiga kūbūr-an*, from its being always planted about graves. The flower is large, white, yellow towards the centre, consisting of five simple, smooth, thick
The **bunga malati** and **bunga malur** (nyctanthes sambac) are different names for the same humble plant, called **mugri** in Bengal. It bears a pretty, white flower, diffusing a more exquisite fragrance, in the opinion of most persons, than any other of which the country boasts. It is much worn by the females; sometimes in wreaths, and various combinations, along with the **bunga tanjong**, and frequently the unblown buds are strung in imitation of rows of pearls. It should be remarked, that the appellative **bunga**, or flower, (pronounced **bungo** in the south-western parts of Sumatra), is almost ever prefixed to the proper name, as **buah** is to fruits. There is also the **malati china** (nyctanthes multiflora); the elegant **bunga malati susun** (nyctanthes acuminata); and the celebrated **bunga tonking** (pergularia odoratissima), whose fascinating sweets have been widely dispersed in England by the successful culture and liberal participation of Sir Joseph Banks. At Madras it obtained the appellation of West-coast, *i.e.* Sumatran creeper, which marks the quarter from whence it was obtained. At Bencoolen, the same appellation is familiarly applied to the **bunga tali-tali** (ipomoea quamoclit), a beautiful, little, monopetalous flower, divided into five angular segments, and closing at sunset. From its bright crimson colour, it received from Rumphius the name of **flos cardinalis**. The plant is a luxuriant creeper, with a hair-like leaf.

The **angsuka**, or **bunga jarum-jarum** (pavetta indica), obtained from Rumphius, on account of the glowing red colour of its long calices, the name of **flamma sylvarum peregrina**. The **bunga marak** (poinciana pulcherrima) is a most splendid flower, the colours being a mixture of yellow and scarlet, and its form being supposed to resemble the crest of the peacock, from whence its Malayan name, which Rumphius translated.
The nāgasāri (calophyllum nagassari) bears a much admired blossom, well known in Bengal; but in the upper parts of India, called nagakeshir, and in the Batavian Trans. acacia aurea. The bakong, or salandap (crinum Asiaticum), is a plant of the lily kind, with six large, white, turbinated petals of an agreeable scent. It grows wild, near the beach, amongst those plants which bind the loose sands. Another and beautiful species of the bakong has a deep shade of purple mixed with the white. The kachubong (datura metel) appears also to flourish mostly by the seaside. It bears a white, infundibuliform flower, rather pentagonal than round, with a small hook at each angle. The leaves are dark green, pointed, broad and unequal at the bottom. The fruit is shaped like an apple, very prickly, and full of small seeds. Sundal malam or harlot of the night (polyanthes tuberosa), is so termed, from the circumstance of its diffusing its sweet odours at that season. It is the tuberose of our gardens, but growing with great vigour and luxuriance. The buṅga māsur (rosa semperfores, Curtis, No. 284), is small, and of a deep crimson colour. Its scent is delicate, and by no means so rich as that yielded by the roses of our climate. The amaranthus cristatus (celosia castreensis, L.) is probably a native, being found commonly in the interior of the Batta country, where strangers have rarely penetrated. The various species of this genus are called by the general name of buyam, of which some are edible, as before observed.

Pandan. Of the pandan (pandanus), a shrub with very long, prickly leaves, like those of the pine-apple or aloe, there are many varieties, of which some are highly fragrant, particularly the pandan waṅī (pandanus odoratissima, L.), which produces a brownish white spath or blossom, one or two feet in length. This the natives shred fine and wear about their persons. The pandan pudak, or keura of Thunberg, which is also fragrant, I have reason to believe the same as the waṅī. The common sort is employed for hedging, and called caldera by Europeans in many parts of India. In the Nicobar islands it is cultivated, and yields a fruit called the melori, which is one of the principle articles of food.

Epidendra. Buṅga anīggrek (epidendrum). The species or varieties of this remarkable tribe of parasitical plants are very numerous, and may be said
said to exhibit a variety of loveliness. Kämpfer describes two kinds by the names of angurek warna and katong'ging; the first of which I apprehend to be the aniggrek buniga putri (angracum scriptum, R.) and the other the aniggrek kasturi (angracum moschatum, R.) or scorpion flower, from its resembling that insect, as the former does the butter-fly. The musky scent resides at the extremity of the tail.4

The buniga tarati or seruja (nymphaea nelumbo) as well as several other beautiful kinds of aquatic plants, are found upon the inland waters of this country. Daum gundi or tabung bru (nepenthes destillatoria) can scarcely be termed a flower, but is a very extraordinary climbing plant. From the extremity of the leaf a prolongation of the mid-rib, resembling the tendril of a vine, terminates in a membrane formed like a tankard with the lid or valve half opened; and growing always nearly erect, it is commonly half full of pure water from the rain or dews. This monkey-cup (as the Malayan name implies) is about four or five inches long and an inch in diameter. Giring landak (crotalaria retusa) is a papilionaceous flower, resembling the lupin, yellow, and tinged at the extremities with red. From the rattling of its seed in the pod it obtains its name, which signifies porcupine-bells, alluding to the small bells worn about the ankles of children. The daup (bauhinia) is a small, white, semiflosculous flower, with a faint smell. The leaves alone attract notice, being double, as if united by a hinge, and this peculiarity suggested the Linnaean name, which was given in compliment to two brothers of the name of Bauhin, celebrated botanists, who always worked conjointly.

To the foregoing list, in every respect imperfect, many interesting plants

4 "Habetur hæc planta apud Javanos in deliciis et magno studio colitur; tum ob floris eximium odorem, quem spirat, moschi; tum ob singularem elegantiam et figuram scorpionis, quam exhibet . . . . . spectaculo sanè jocundissimo, ut negem quicquam elegantius et admiratione dignius in regno vegetabili me vidisse . . . . . Odorem flos moschi exquisitissimum atque adeo copiosum spargit, ut unicus stylus floridus totum conclave impleat. Qui verò odor, quod maximè mireris, in extremà parte petali caudam referentis, residet; quà abicingvà, omnis cessat odoris expiratio." Amoen exoticae, p. 868.
plants might be added by an attentive and qualified observer. The natives themselves have a degree of botanical knowledge that surprises Europeans. They are in general, and at a very early age, acquainted not only with the names, but the properties of every shrub and herb amongst that exuberant variety with which the island is clothed. They distinguish the sexes of many plants and trees, and divide several of the genera into as many species as our professors. Of the paku or fern I have had specimens brought to me of twelve sorts, which they told me were not the whole, and to each they gave a distinct name.

Some of the shrubs and herbs employed medicinally are as follows. Scarcely any of them are cultivated, being culled from the woods or plains as they happen to be wanted.

*Lagundi* (vitex trifolia, L.). The botanic characters of this shrub are well known. The leaves, which are bitter and pungent rather than aromatic, are considered as a powerful antiseptic, and are employed in fevers in the place of Peruvian bark. They are also put into granaries, and among cargoes of rice to prevent the destruction of the grain by weevils.

*Katupong* resembles the nettle in growth; in fruit the blackberry. I have not been able to identify it. The leaf, being chewed, is used in dressing small fresh wounds. *Siu* or wild fig, is applied to the scurf or leprosy of the Nias people, when not inveterate. *Sikaduduk* (melastoma) has the appearance of a wild rose. A decoction of its leaves is used for the cure of a disorder in the sole of the foot, called *maltus*, resembling the impetigo or ring-worm. *Ampadu-brüang* or bear's gall (brucea, foliis serratis) is the *lussa raja* of Rumphius, excessively bitter, and applied in infusion, for the relief of disorders in the bowels. *Kabu* (unknown). Of this the bark and root are used for curing the *kūdis* or itch, by rubbing it on the part affected. *Marampuyan* (a new genus). The young shoots of this, being supposed to have a refreshing and corroborating quality, are rubbed over the body and limbs after violent fatigue. *Mali-mali* (unknown). The leaf of this plant, which bears a white umbellated blossom, is applied to reduce swellings.
Swelling. *Chapo* (*conyza balsamifera*) resembles the sage (*salvia*) in colour, smell, taste, and qualities, but grows to the height of six feet, has a long jagged leaf, and its blossom resembles that of groundsel. *Murribuñgan* (unknown). The leaves of this climber are broad, roundish, and smooth. The juice of its stalk is applied to heal excoriations of the tongue. *Ampi-ampi* (unknown). A climbing plant, with leaves resembling the box, and a small flosculous blossom. It is used as a medicine in fevers. *Kadu* (sp. of *piper*), with a leaf in shape and taste resembling the betel. It is burned to preserve children newly-born from the influence of evil spirits. *Gumbai* (unknown). A shrub with monopitalous, stillated, purple flowers, growing in tufts. The leaves are used in disorders of the bowels. *Tabulan bukan* (unknown). A shrub bearing a semiflosculous blossom, applied to the cure of sore eyes. *Kachang prang* (dolichos ensiformis). The pods of this are of a huge size, and the beans, of a fine crimson colour, are used in diseases of the pleura. *Sipit*, a species of *fig*, with a large oval leaf, rough to the touch, and rigid. An infusion of it is swallowed in iliac affections. *Daun se-dini̇gin* (cotyledon laciniata). This leaf, as the name denotes, is of a remarkably cold quality. It is applied to the forehead to cure the head-ach, and sometimes to the body in fevers. Long pepper (*piper longum*) is used medicinally. Turmeric, also, mixed with rice reduced to powder, and then formed into a paste, is much used outwardly, in cases of colds, and pains in the bones; and chunam or quick lime, is likewise commonly rubbed on parts of the body affected with pain. In the cure of the *kura* or boss (from the Portuguese word *baço*), which is an obstruction of the spleen, forming a hard lump in the upper part of the abdomen, a decoction of the following plants is externally applied: *sipit tuñgul*; *madang tandok* (a new genus, highly aromatic); *ati ayer* (sp. of *arum?*); *tapa besi*; *paku tiong* (a most beautiful fern, with leaves like a palm; genus not ascertained); *tapa badak* (a variety of *callicarpa*); *laban* (*vitex altissima*); *pisang ruko* (sp. of *musa*); and *paku lamiding* (sp. of *polypodium?*); together with a juice extracted from the *akar malabatei* (unknown). In the cure of the *kurap*, tetter or ringworm, they apply the *daun galiñggan* (cassia quadri-alata) an herbaceous shrub, with large pinnated leaves and a yellow blossom. In the more inveterate cases, *barañgan* (coloured arsenic, or *orpiment*), a strong poison, is rubbed in.
in. The milky exudation from the *sudu-sudu* (euphorbia nerii folia) is valued highly by the natives for medicinal purposes. Its leaves eaten by sheep or goats occasion present death.

On the subject of the *pūhn ṣūpaś* or poison tree (arbore toxicaria, R.), of whose properties so extraordinary an account was published in the London Magazine for September, 1785, by Mr. N.P. Foersch, a surgeon in the service of the Dutch East India Company, at that time in England, I shall quote the observations of the late ingenious Mr. Charles Campbell, of the medical establishment at Fort Marlborough. “On my travels in the country at the back of Bencoolen I found the ṣūpaś tree, about which so many ridiculous tales have been told. Some seeds must by this time have arrived in London in a packet I forwarded to Mr. Aiton at Kew. The poison is certainly deleterious, but not in so terrific a degree as has been represented. Some of it in an insulated state you will receive by an early opportunity. As to the tree itself, it does no manner of injury to those around it. I have sat under its shade, and seen birds alight upon its branches; and as to the story of grass not growing beneath it, every one who has been in a forest must know that grass is not found in such situations.” For further particulars respecting this poison-tree, which has excited so much interest, the reader is referred to Sir George Staunton’s Account of Lord Macartney’s Embassy, Vol. I. p. 272.; to Pennant’s Outlines of the Globe, Vol. IV. p. 42. where he will find a copy of Foersch’s original narrative; and to a Dissertation by Professor C. P. Thunberg upon the Arbor toxicaria Macassariensiis, in the Mem. of the Upsal Acad. for 1788. The information given by Rumphius upon the subject of the *Ipo* or *Upas*, in his Herb. Amboin. Vol. II. p. 263. will also be perused with satisfaction. It is evident that some of the exaggerated stories related to him...
by the people of Celebes (the plant not being indigenous at Amboina) suggested to Mr. Foersch, the fables with which he amused the world.

of the genus strychnos, called tieute by the natives of Java; and the latter to be a milky, bitter, and yellowish juice, running from an incision in the bark of a large tree (new genus) called antiar; the word upas meaning, as M. Leschenault understands, vegetable poison of any kind. A small branch of the puhn upas, with some of the poisonous gum, was brought to England in 1806, by Dr. Roxburg, who informed Mr. Lambert that a plant of it which he had procured from Sumatra was growing rapidly in the Company’s Botanic Garden at Calcutta. A specimen of the gum, by the favour of the latter gentleman, is in my possession.
The animal kingdom claims attention, but the quadrupeds of the island being in general the same as are found elsewhere throughout the East, already well described, I shall do little more than furnish a list of those which have occurred to my notice; adding a few observations on such as may appear to require them.

The karbau, or buffalo, constituting a principal part of the food of the natives, and being the only animal employed in their domestic labours, it is proper that I should enter into some detail of its qualities and uses; although it may be found not to differ materially from the buffalo of Italy, and to be the same with that of Bengal. The individuals of the species, as is the case with other domesticated cattle, differ extremely from each other in their degree of perfection, and a judgment is not to be formed of the superior kinds, from such as are usually furnished as provision to the ships from Europe. They are distinguished into two sorts; the black and the white. Both are equally employed in work, but the latter is seldom killed for food, being considered much inferior in quality, and by many as unwholesome, occasioning the body to break out in blotches. If such be really the effect, it may be presumed that the light flesh-colour is itself the consequence of some original disorder, as in the case of those of the human species who are termed white negroes. The hair upon this sort is extremely thin, scarcely serving to cover the hide; nor have the black buffaloes a coat like the cattle of England. The legs are shorter than those of the ox, the hoofs larger, and the horns are quite peculiar, being rather square or flat than round, excepting near the extremities; and whether pointing backward, as in general, or forwards, as they often do, are always in the plane of the forehead, and not at an angle, as those of the cow-kind. They contain much solid substance, and are valuable in manufacture. The tail hangs down
down to the middle joint of the leg only, is small, and terminates in a bunch of hair. The neck is thick and muscular, nearly round, but somewhat flatted at top, and has little or no dewlap dependant from it. The organ of generation in the male has an appearance as if the extremity were cut off. It is not a salacious animal. The female goes nine months with calf, which it suckles during six, from four teats. When crossing a river it exhibits the singular sight of carrying its young one on its back. It has a weak cry, in a sharp tone, very unlike the lowing of oxen. The most part of the milk and butter required for the Europeans (the natives not using either) is supplied by the buffalo, and its milk is richer than that of the cow, but not yielded in equal quantity. What these latter produce is also very small compared with the dairies of Europe. At Batavia, likewise, we are told that their cows are small and lean, from the scantiness of good pasture, and do not give more than about an English quart of milk, sixteen of which are required to make a pound of butter.

The inland people, where the country is tolerably practicable, avail themselves of the strength of this animal to draw timber felled in the woods: the Malays and other people on the coast train them to the draft, and in many places to the plough. Though apparently of a dull, obstinate, capricious nature, they acquire from habit a surprising docility, and are taught to lift the shafts of the cart with their horns, and to place the yoke, which is a curved piece of wood attached to the shafts, across their necks; needing no further harness than a breast-band, and a string that is made to pass through the cartilage of the nostrils. They are also, for the service of Europeans, trained to carry burthens suspended from each side of a pack-saddle, in roads, or rather paths, where carriages cannot be employed. It is extremely slow, but steady in its work. The labour it performs, however, falls short of what might be expected from its size and apparent strength, any extraordinary fatigue, particularly during the heat of the day, being sufficient to put a period to its life, which is at all times precarious. The owners frequently experience the loss of large herds, in a short space of time, by an epidemic distemper, called bandung (obstruction), that seizes them suddenly, swells their bo-
dies, and occasions, as it is said, the serum of the blood to distil through the tubes of the hairs.

The luxury of the buffalo consists in rolling itself in a muddy pool, which it forms, in any spot, for its convenience, during the rainy season. This it enjoys in a high degree, dexterously throwing with its horn the water and slime, when not of a sufficient depth to cover it, over its back and sides. Their blood is perhaps of a hot temperature, which may render this indulgence, found to be quite necessary to their health, so desirable to their feelings; and the mud, at the same time, forming a crust upon their bodies, preserves them from the attack of insects, which otherwise prove very troublesome. Their owners light fires for them in the evening, in order that the smoke may have the same effect, and they have the instinctive sagacity to lay themselves down to leeward, that they may enjoy its full benefit.

Although common in every part of the country, they are not understood to exist in the proper wild or indigenous state, those found in the woods being termed karbau jalang, or stray buffaloes, and considered as the subject of property; or if originally wild, they may afterwards, from their use in labour and food, have been all caught and appropriated by degrees. They are gregarious, and usually found in large numbers together, but sometimes met with singly, when they are more dangerous to passengers. Like the turkey, and some other animals, they have an antipathy to a red colour, and are excited by it to mischief. When in a state of liberty they run with great swiftness, keeping pace with the speed of an ordinary horse. Upon an attack or alarm they fly to a short distance, and then suddenly face about and draw up in battle-array with surprising quickness and regularity; their horns being laid back, and their muzzles projecting. Upon the nearer approach of the danger that presses on them, they make a second flight, and a second time halt and form; and this excellent mode of retreat, which but few nations of the human race have attained to such a degree of discipline as to adopt, they continue till they gain the fastnesses of a neighbouring wood. Their principal foe, next to man, is the tiger; but only the weaker sort, and the females
females fall a certain prey to this ravager, as the sturdy male buffalo can support the first vigorous stroke from the tiger's paw, on which the fate of the battle usually turns.

The cow, called sapi (in another dialect sampi) and jawi, is obviously a stranger to the country, and does not appear to be yet naturalized. The bull is commonly of what is termed the Madagascar breed, with a large hump upon the shoulders, but from the general small size of the herds, I apprehend that it degenerates, from the want of good pasture, the spontaneous production of the soil being too rank.

The horse, kuda: the breed is small, well made, and hardy. The country people bring them down in numbers for sale in nearly a wild state; chiefly from the northward. In the Batta country they are eaten as food; which is a custom also amongst the people of Celebes.

Sheep, biri-biri and domba: small breed, introduced probably from Bengal. Goat, kambing: beside the domestic species, which is in general small and of a light brown colour, there is the kambing utan, or wild goat. One which I examined was three feet in height, and four in the length of the body. It had something of the gazelle in its appearance, and, with the exception of the horns, which were about six inches long and turned back with an arch, it did not much resemble the common goat. The hinder parts were shaped like those of a bear, the rump sloping round off from the back; the tail was very small, and ended in a point; the legs clumsy; the hair along the ridge of the back rising coarse and strong, almost like bristles; no beard; over the shoulder was a large spreading tuft of greyish hair; the rest of the hair black throughout; the scrotum globular. Its disposition seemed wild and fierce, and it is said by the natives to be remarkably swift. Hog, babi: that breed we call Chinese. The wild hog, babi utan. Dog, anjing: those brought from Europe lose in a few years their distinctive qualities, and degenerate at length into the cur with erect ears, kuyu, vulgarly called the pariah dog. An instance did not occur of any one going mad during the period of my residence. Many of them are affected with a kind of gonorrhœa. Otter, anjing ayer (mustela lutra). Cat, kuching: these in every respect resemble
resemble our common domestic cat, excepting that the tails of all are more or less imperfect, with a knob or hardness at the end, as if they had been cut or twisted off. In some the tail is not more than a few inches in length, whilst in others it is so nearly perfect, that the defect can be ascertained only by the touch. Rat, tikūs: of the grey kind. Mouse, tikūs kechil.

Elephant. Elephant, gajah: these huge animals abound in the woods, and from their gregarious habits usually traversing the country in large troops together, prove highly destructive to the plantations of the inhabitants, obliterating the traces of cultivation by merely walking through the grounds; but they are also fond of the produce of their gardens, particularly of plantain trees and the sugar-cane, which they devour with eagerness. This indulgence of appetite often proves fatal to them, for the owners knowing their attachment to these vegetables, have a practice of poisoning some part of the plantation, by splitting the canes and putting yellow arsenic into the clefts; which the animal unwarily eats of, and dies. Not being by nature carnivorous, the elephants are not fierce, and seldom attack a man but when fired at or otherwise provoked. Excepting a few kept for state by the king of Achin, they are not tamed in any part of the island.

Rhinoceros. The rhinoceros, badak, both that with a single horn and the double horned species, are natives of these woods. The latter has been particularly described by the late ingenious Mr. John Bell (one of the pupils of Mr. John Hunter) in a paper printed in Vol. LXXXIII. of the Phil. Trans. for 1793. The horn is esteemed an antidote against poison, and on that account formed into drinking cups. I do not know any thing to warrant the stories told of the mutual antipathy, and the desperate encounters of these two enormous beasts.

Hippopotamus. Hippopotamus, kūda ayer: the existence of this quadruped in the island of Sumatra having been questioned by M. Cuvier, and not having myself actually seen it, I think it necessary to state that the immediate authority upon which I included it in the list of animals found there, was a drawing made by Mr. Whalfeldt, an officer employed on a survey of
of the coast, who had met with it at the mouth of one of the southern
rivers, and transmitted the sketch along with his report to the govern-
ment, of which I was then secretary. Of its general resemblance to that
well-known animal there could be no doubt. M. Cuvier suspects that
I may have mistaken for it the animal called by naturalists the 
dugong,
and vulgarly the sea-cow, which will be hereafter mentioned; and it
would indeed be a grievous error to mistake for a beast with four legs, a
fish with two pectoral fins serving the purposes of feet; but, independ-
ently of the authority I have stated, the kūda-ayer, or river-horse, is
familiarly known to the natives, as is also the dugong (from which Ma-
layan word the dugong of naturalists has been corrupted); and I have
only to add, that in a register given by the Philosophical Society of Ba-
tavia, in the first Vol. of their Transactions, for 1799, appears the article
“couda aijeer, rivier paard, hippopotamus” amongst the animals of
Java.

Bear, brūang: generally small and black: climbs the coconut trees in
order to devour the tender part or cabbage. Of the deer kind there
are several species: rusa, the stag, of which some are very large; kijang,
the roe, with unbranched horns, the emblem of swiftness and wildness
with the Malayan poets; palandok, napu, and kanchil, three varieties,
of which the last is the smallest, of that most delicate animal, termed by
Buffon the chevrotin, but which belong to the moschus. Of a kanchil
measured at Batavia, the extreme length was sixteen inches, and the
height ten behind, and eight at the shoulder. Babi-rusa, or hog-deer:
an animal of the hog kind, with peculiar tusks resembling horns. Of
this there is a representation in Valentyn, Vol. III. p. 268. fig. c. and
also in the very early travels of Cosmas, published in Thevenot’s Collect.
Vol. I. p. 2. of the Greek Text. The varieties of the monkey tribe are
innumerable: among them the best known are the muniet, karra, bru,
siāmang (or simia gibbon of Buffon), and lutong. With respect to the
appellation of orang utan, or wild man, it is by no means specific, but
applied to any of these animals of a large size that occasionally walks
erect, and bears the most resemblance to the human figure. Sloth, ku-
kang, ka-malas-an (lemur tardigradus). Squirrel, tupei; usually small
and dark-coloured. Teleggo, stinkard.
Tiger.

Tiger, arimau, machang: this beast is here of a very large size, and proves a destructive foe to man as well as to most other animals. The heads being frequently brought in to receive the reward given by the East India Company for killing them, I had an opportunity of measuring one, which was eighteen inches across the forehead. Many circumstances respecting their ravages, and the modes of destroying them, will occur in the course of the work. Tiger-cat, kuching-rimau (said to feed on vegetables as well as flesh). Civet-cat, taniggalong (viverra civetta): the natives take the civet, as they require it for use, from a peculiar receptacle under the tail of the animal. It appears from the Ayin Akbari (Vol. I. p. 103.) that the civet used at Dehli was imported from Achin. Pole-cat, musang (viverra fossa, or a new species). Porcupine (hystrix longicauda) landak, and, for distinction, babi landak. Hedge-hog (erinaceus) landak. Peñ-goling, signifying the animal which rolls itself up; or pangolín of Buffon: this is distinguished into the peñ-goling rambut, or hairy sort (myrmophoga), and the peñ-goling sisik, or scaly sort, called more properly tanigaling (species of manis); the scales of this are esteemed by the natives for their medicinal properties. See Asiat. Researches, Vol. I. p. 376. and Vol. II. p. 353.

Peng-goling.

Bats.

Of the bat kind there is an extraordinary variety: the churi-churi is the smallest species, called vulgarly burong tikus, or the mouse-bird; next to these is the kalalawar; then the kalambit; and the kalwong (nortilio) is of considerable size; of these I have observed very large flights occasionally passing at a great height in the air, as if migrating from one country to another, and Captain Forrest notices their crossing the straits of Sunda from Java head to Mount Pugong; they are also seen hanging by hundreds upon trees. The flying foxes and flying squirrels (lemur volans), which by means of a membrane extending from what may be termed the fore-legs to those behind, are enabled to take short flights, are also not uncommon.

Aliigators and other lizards.

Aliigators, buaya, (crocodilus biporcatus of Cuvier) abound in most of the rivers, grow to a large size, and do much mischief. The guana, or iguana, biawak (lacerta iguana) is another animal of the lizard kind, about three or four feet in length, harmless, excepting to the poultry and
and young domestic cattle, and sometimes itself eaten as food. The *biṅgkarong* is next in size, has hard, dark scales on the back, and is often found under heaps of decayed timber; its bite venomous. The *kokē, gokē*, or *tokē*, as it is variously called, is a lizard, about ten or twelve inches long, frequenting old buildings, and making a very singular noise. Between this and the small house-lizard (*chichak*) are many gradations in size, chiefly of the grass-lizard kind, which is smooth and glossy. The former are in length from about four inches down to an inch or less, and are the largest reptiles that can walk in an inverted situation: one of these, of size sufficient to devour a cockroach, runs on the ceiling of a room, and in that situation seizes its prey with the utmost facility. This they seem to be enabled to do, from the rugose structure of their feet, with which they adhere strongly to the smoothest surface. Sometimes, however, on springing too eagerly at a fly, they lose their hold, and drop to the floor; on which occasions a circumstance occurs not undeserving of notice. The tail being frequently separated from the body by the shock (as it may be, at any of the vertebrae, by the slightest force, without loss of blood or evident pain to the animal, and sometimes, as it would seem, from the effect of fear alone) within a little time, like the mutilated claw of a lobster, begins to renew itself. They are produced from eggs about the size of the wren’s, of which the female carries two at a time, one in the lower, and one in the upper part of the abdomen, on opposite sides; they are always cold to the touch, and yet the transparency of their bodies gives an opportunity of observing that their fluids have as brisk a circulation as those of warm-blooded animals: in none have I seen the peristaltic motion so obvious as in these. It may not be useless to mention that these phenomena were best observed at night, when the lizard was on the outside of a pane of glass, with a candle on the inside. There is, I believe, no class of living creatures in which the gradations can be traced with such minuteness and regularity as in this; where, from the small animal just described, to the huge alligator or crocodile, a chain may be traced containing almost innumerable links, of which the remotest have a striking resemblance to each other, and seem, at first view, to differ only in bulk. The cameleon, *gruning*: Cameleon.

these are about a foot and half long, including the tail; the colour, green with brown spots, as I had it preserved; when alive in the woods they are
are generally green, but not from the reflection of the leaves, as some have supposed. When first caught they usually turn brown, apparently the effect of fear or anger, as men become pale or red; but, if undisturbed, soon resume a deep green on the back, and a yellow green on the belly, the tail remaining brown. Along the spine, from the head to the middle of the back, little membranes stand up like the teeth of a saw. As others of the genus of lacerta they feed on flies and grass-hoppers, which the large size of their mouths, and peculiar structure of their bony tongues, are well adapted for catching. The flying lizard, *kubin*, or *chachak terbang* (*draco volans*), is about eight inches in its extreme length, and the membranes which constitute the wings are about two or three inches in extent. These do not connect with the fore and hind legs, as in the bat tribe, but are supported by an elongation of the alternate ribs, as pointed out by my friend Mr. Everard Home. They have flapped ears, and a singular kind of pouch or alphorges, under the jaws. In other respects they much resemble the cameleon in appearance. They do not take distant flights, but merely from tree to tree, or from one bough to another. The natives take them by springes fastened to the stems.

**Frogs.**

With animals of the frog kind (*kodok*) the swamps everywhere teem; and their noise upon the approach of rain is tremendous. They furnish prey to the snakes, which are found here of all sizes and in great variety of species; the larger proportion harmless, but of some, and those generally small and dark-coloured, the bite is mortal. If the cobra *capelo*, or hooded snake, be a native of the island, as some assert, it must be extremely rare. The largest of the boa kind (*ular sauh*) that I had an opportunity of observing, was no more than twelve feet long. This was killed in a hen-house, where it was devouring the poultry. It is very surprising, but not less true, that snakes will swallow animals of twice or three times their own apparent circumference; having in their jaws or throat a compressive force that gradually and by great efforts reduces the prey to a convenient dimension. I have seen a small snake (*ular sini*) with the hinder legs of a frog sticking out of its mouth, each of them nearly equal to the smaller parts of its own body, which in the thickest did not exceed a man’s little finger. The stories told of their swallowing deer,
deer, and even buffaloes, in Ceylon and Java, almost choke belief, but I cannot take upon me to pronounce them false; for if a snake of three inches diameter can gorge a fowl of six, one of thirty feet in length, and proportionate bulk and strength, might well be supposed capable of swallowing a beast of the size of a goat; and I have respectable authority for the fact, that the fawn of a kijang or roe was cut out of the body of a very large snake killed at one of the southern settlements. The poisonous kinds are distinguished by the epithet of ular bisa, among which is the biludak or viper. The ular garang, or sea-snake, is coated entirely with scales, both on the belly and tail, not differing from those on the back, which are small and hexagonal; the colour is grey, with here and there shades of brown. The head and about one-third of the body from thence is the smallest part, and it increases in bulk towards the tail, which resembles that of the eel. It has not any dog-fangs.

The tortoise, kura-kura, and turtle, katong, are both found in these seas; the former valuable for its scales, and the latter as food; the land-tortoise (testudo græca) is brought from the Sechelles Islands. There is also an extensive variety of shell-fish. The cray-fish, udang laut (cancer homarus or écrevisse de mer), is as large as the lobster, but wants its biting claws. The small fresh water cray-fish, the prawns and shrimps, (all named udang, with distinctive epithets), are in great perfection. The crab, kapiting and katam (cancer), is not equally fine, but exhibits many extraordinary varieties. The kima, or gigantic cockle, (chama) has been already mentioned (p. 15). The oysters, tiram, are by no means so good as those of Europe. The smaller kind are generally found adhering to the roots of the mangrove, in the wash of the tide. The muscle, kupang (mytilus), rimis (donax), kapung (teredo navalis), sea-egg, bulu babi (echinus), hia papeda (nautilus), ruma gorila (argonauta), bia unam (murex), bia balang (cuprea), and many others may be added to the list. The beauty of the madrepores and corallines, of which the finest specimens are found in the recesses of the Bay of Tappanuti, is not to be surpassed in any country. Of these a superb collection is in the possession of Mr. John Griffiths, who has given, in Vol. XCVI. of the Phil. Trans. the “Description of a rare species of Worm-Shells, discovered at an island lying off the NW. coast of Sumatra.” In the same volume
volume is also a Paper by Mr. Everard Home, containing "Observations on the Shell of the Sea Worm found on the Coast of Sumatra, proving it to belong to a species of Teredo; with an Account of the Anatomy of the Teredo Navalis." The former he proposes to call the teredo gigantea. The sea-grass, or ladang laut, concerning which Sir James Lancaster tells some wonderful stories, partakes of the nature of a sea-worm and of a coralline; in its original state it is soft and shrinks into the sand from the touch; but when dry it is quite hard, straight, and brittle.

Fish.

The düyöng is a very large sea-animal or fish, of the order of mammalia, with two large pectoral fins serving the purposes of feet. By the early Dutch voyagers it was, without any obvious analogy, called the sea-cow; and from the circumstance of the head being covered with a kind of shaggy hair, and the mammae of the female being placed immediately under the pectus, it has given rise to the stories of mermaids in the tropical seas. The tusks are applied to the same uses as ivory, especially for the handles of kriises, and being whiter are more prized. It has much general resemblance to the manati or lamantin of the West Indies, and has been confounded with it; but the distinction between them has been ascertained by M. Cuvier, Annales du Mus. d' H. Nat. XXII. cahier, p. 308.

Whale.

The grampus whale (species of delphinus) is well known to the natives by the names of pāwus and gajah mīna; but I do not recollect to have heard any instance of their being thrown upon the coast. Of the ikan layer (genus novum schombro affine) a grand specimen is preserved in the British Museum, where it was deposited by Sir Joseph Banks; and a description of it by the late M. Brousonet, under the name of le Voilier, is published in the Mem. de l' Acad. de Scien. de Paris for 1786, p. 450.

* "Sometime ago (says Captain Forrest) a large fish, with valuable teeth, being cast ashore in the Illano districts, there arose a dispute who should have the teeth, but the Magindanoers carried it." Voyage to New Guinea, p. 272. See also Valentyn, Vol. III. p. 341.

* This fish was hooked by Mr. John Griffiths near the southern extremity of the west coast of Sumatra, and was given to Captain Cumming of the Britannia indiaman, by whom it was presented to Sir Joseph Banks.
p. 450, pl. x. It derives its appellation from the peculiarity of its dorsal fin, which rises so high as to suggest the idea of a sail; but it is most remarkable for what should rather be termed its snout than its horn, being an elongation of the frontal bone, and the prodigious force with which it occasionally strikes the bottoms of ships, mistaking them, as we may presume, for its enemy or prey. A large fragment of one of these bones, which had transfixèd the plank of an East India ship, and penetrated about eighteen inches, is likewise preserved in the same national collection, together with the piece of plank, as it was cut out of the ship's bottom upon her being docked in England. Several accidents of a similar nature are known to have occurred. There is an excellent representation of this fish, under the name of fetisso, in Barbot's Description of the Coasts of Guinea, plate 18, which is copied in Astley's Collection of Voyages, Vol. II. plate 73.

To attempt an enumeration of the species of fish with which these seas abound, would exceed my power, and I shall only mention briefly some of the most obvious; as the shark, hiyu (squalus); skate, ikan pari, (raya); ikan múa (muræna); ikan chanak (gymnotus); ikan gajah (cepole); ikan karang or bonne (chætodon), described by Mr. John Bell, in Vol. LXXXII. of the Phil. Trans. It is remarkable for certain tumours filled with oil, attached to its bones. There are also the ikan krapo, a kind of rock-cod or sea-perch; ikan marrang or kitang (teuthis), commonly named the leather fish, and among the best brought to table; jinnihin, a rock-fish shaped like a carp; bawal or pomfret (species of chætodon); balānak, jumpul, and marra, three fish of the mullet kind (mugil); kuru (polynemus); ikan lidah, a kind of sole; tiṅgēri, resembles the mackerel; gagu, cat-fish; summa, a river fish, resembling the salmon; riṅgis, resembles the trout, and is noted for the size of its roe; ikan tambarah, I believe the shad of Siak River; ikan gadis, good river fish, about the size of a carp; ikan bada, small, like white bait; ikan gorita, sepia; ikan terbang, flying-fish (exocœtus). The little sea-horse (syngnathus hippocampus) is commonly found here.

Of birds the variety is considerable, and the following list contains but a small portion of those that might be discovered in the island by a qualified
SUMATRA.

The kuwau, or Sumatran pheasant (phasianus argus), is a bird of uncommon magnificence and beauty; the plumage being perhaps the most rich, without any mixture of gaudiness, of all the feathered race. It is found extremely difficult to keep it alive for any considerable time after catching it in the woods, yet it has in one instance been brought to England; but having lost its fine feathers by the voyage, it did not excite curiosity, and died unnoticed. There is now a good specimen in the Liverpool Museum. It has, in its natural state, an antipathy to the light, and in the open day is quite moped and inanimate. When kept in a darkened place it seems at its ease, and sometimes makes use of the note or call from which it takes its name, and which is rather plaintive than harsh. The flesh, of which I have eaten, perfectly resembles that of the common pheasant (tagang), also found in the woods, but the body is of much larger size. I have reason to believe that it is not, as supposed, a native of the North or any part of China. From the Malayan Islands, of which it is the boast, it must be frequently carried thither. The peacock, burong marak (pavo), appears to be well known to the natives, though, I believe, not common. I should say the same of the eagle and the vulture (coracias), to the one or the other of which the name of raja wali is familiarly applied. The kite, alang (falco), is very common, as is the crow, gadak (corvus), and jack-daw, pong (gracula), with several species of the wood-pecker. The king-fisher (alcedo) is named burong buāya, or the aligator bird. The bird of paradise, burong supan, or elegant bird, is known here only in the dried state, as brought from the Moluccas and coast of New Guinea (tanah papuah).

The rhinoceros bird, horn-bill, or calao (buceros), called by the natives anggang and burong tāun, is chiefly remarkable for what is termed the horn, which in the most common species extends half way down the upper mandible of its large beak, and then turns up; but the varieties of shape are numerous. The length of one I measured whilst alive was ten inches and an half; the breadth, including the horn, six and an half;
length from beak to tail four feet; wings four feet six inches; height one foot; length of neck one foot; the beak whitish; the horn yellow and red; the body black; the tail white ringed with black; rump, and feathers on the legs down to the heel, white; claws three before and one behind; the iris red. In a hen chick there was no appearance of a horn, and the iris was whitish. They eat either boiled rice or tender fresh meat. Of the use of such a singular cavity I could not learn any plausible conjecture. As a receptacle for water, it must be quite unnecessary in the country of which it is a native.

Of the stork kind there are several species, some of great height and otherwise curious, as the burong kambing and burong ular, which frequent the rice plantations in wet ground. We find also the heron, burong kuntul (ardea); the snipe, kandidi (scolopax); the coot, or water hen, ayam ayer (fulica); and the plover, cheruling (charadrius). The cassawary, burong rusa, is brought from the island of Java.

The domestic hen is as common as in most other countries. In some the bones (or the periostea) are black, and these are at least equally good as food. The hen of the woods, ayam barugo, or ayam utan, (which latter name is in some places applied to the pheasant) differs little from the common sort, excepting in the uniformity of its brown colour. In the Lampong country, of Sumatra, and western part of Java lying opposite to it, there is a very large breed of fowls, called ayam jago; of these I have seen a cock peck from off of a common dining table; when inclined to rest, they sit on the first joint of the leg, and are then taller than the ordinary fowls. It is singular, if the same country produces likewise the diminutive breed that goes by the name of Bantam. A species of partridge is called ayam gunong, or mountain hen.

Beside the pigeon, merapeti and burong darah (columba), and two common species of doves, the one of a light brown or dove-colour, called ballum, and the other green, called punei, there are of the latter some most exquisite varieties: the punei jambu is smaller than the usual size of doves; the back, wings, and tail, are green; the breast and crop are white, but the front of the latter has a slight shade of pink; the fore-part
part of the head is of a deep pink, resembling the blossom of the *jambu* fruit, from whence its name; the white of the breast is continued in a narrow streak, having the green on one side and the pink on the other, half round the eye, which is large, full, and yellow; of which colour is also the beak. It will live upon boiled rice and *padi*; but its favourite food, when wild, is the berry of the *rumpunmei* (*ardisia coriacea*), perhaps from this circumstance so called. The *selaya*, or *punei andu*, another variety, has the body and wings of deep crimson, with the head, and extremity of its long indented tail, white; the legs red. It lives on the worms generated in the decayed part of old trees, and is about the size of a blackbird. Of the same size is the *burong sawei*, a bird of a bluish black colour, with a dove-tail, from which extend two very long feathers, terminating circularly. It seems to be what is called the widow bird, and is formidable to the kite. The *burong pipit* resembles the sparrow in its appearance; habits, numbers, and the destruction it causes to the grain. The quail, *puyuh* (*coturnix*); but whether a native or a bird of passage, I cannot determine. The starling (*sturnus*), of which I know not the Malayan name. The swallow, *layang-layang* (*hirundo*), one species of which, called *layang bûhi*, from its being supposed to collect the froth of the sea, is that which constructs the edible nests. The *mu-rei*, or dial-bird, resembling a small magpie, has a pretty but short note. There is not any bird in the country that can be said to sing. The *ti-yong*, or *mino*, a black bird with yellow gills, has the faculty of imitating human speech in greater perfection than any other of the feathered tribe. There is also a yellow species, but not loquacious. Of the parrot kind the variety is not so great as might be expected, and consists chiefly of those denominated paroquets. The beautiful *luri*, though not uncommon, is brought from the eastward. The *kakatua* is an inhabitant chiefly of the southern extremity of the island.

The Indian goose, *aṅgsa* and *gaṅgsa* (*anser*); the duck, *bebek* and *itik* (*anas*); and the teal, *belībi*, are common.

With insects the island may truly be said to swarm; and I doubt whether there is any part of the world where greater variety is to be found. Of these I shall only attempt to enumerate a few: the *kunang*, or firefly,
fly, larger than the common fly, (which it resembles), with the phos-
phoric matter in the abdomen, regularly and quickly intermitting its
light, as if by respiration; by holding one of them in my hand I could
see to read at night; lipas, the cockroach (blatta); chingkarek, the
cricket (gryllus); lebah, taun, the bee (apis), whose honey is gathered
in the woods; kumbang, a species of apis, that bores its nest in timber,
and thence acquires the name of the carpenter; sumut, the ant (formica),
the multitudes of which overrun the country, and its varieties are not
less extraordinary than its numbers. The following distinctions are the
most obvious: the kraįgga, or great red ant, about three-fourths of an
inch long, bites severely, and usually leaves its head, as a bee its sting,
in the wound; it is found mostly on trees and bushes, and forms its nest
by fastening together, with a glutinous matter, a collection of the leaves
of a branch, as they grow; the common red ant; the minute red ant;
the large black ant, not equal in size to the kraįgga, but with a head of
disproportioned bulk; the common black ant; and the minute black
ant: they also differ from each other in a circumstance which I believe
has not been attended to; and that is the sensation with which they a-
ffect the taste when put into the mouth, as frequently happens uninten-
tionally: some are hot and acrid, some bitter, and some sour. Perhaps
this will be attributed to the different kinds of food they have acciden-
tally devoured; but I never found one which tasted sweet, though I have
cought them in the fact of robbing a sugar or honey-pot. Each species
of ant is a declared enemy of the other, and never suffers a divided em-
prise. Where one party effects a settlement, the other is expelled; and
in general they are powerful in proportion to their bulk, with the excep-
tion of the white ant, sumut putih (termes), which is beaten from the field
by others of inferior size; and for this reason it is a common expedient
to strew sugar on the floor of a warehouse, in order to allure the formicæ
to the spot, who do not fail to combat and overcome the ravaging, but
unwarlike termites. Of this insect and its destructive qualities I had in-
tended to give some description, but the subject is so elaborately treated
(though with some degree of fancy) by Mr. Smeathman in Vol. LXXI.
of the Phil. Trans. for 1781, who had an opportunity of observing them
in Africa, that I omit it as superfluous. Of the wasp kind there are
several curious varieties. One of them may be observed building its nest
of moistened clay against a wall, and inclosing in each of its numerous compartments a living spider; thus revenging upon this blood-thirsty race the injuries sustained by harmless flies, and providently securing for its own young a stock of food. Lalat, the common fly (musca); lalat kuda (tabanus); lalat karbau (œstrus); niamok, agas, the gnat or mosquito (culex), producing a degree of annoyance equal to the sum of all the other physical plagues of a hot climate, but even to these I found that habit rendered me almost indifferent; kala-jingking, the scorpion (scorpio), the sting of which is highly inflammatory and painful, but not dangerous; sipasang, centipede (scholopendra), not so venomous as the preceding; alipan (jules); alintah, water-leech (hirudo); achih, small land-leech, dropping from the leaves of trees whilst moist with dew, and troublesome to travellers in passing through the woods. To this list I shall only add the suala, tripan, or sea-slug (holothurion), which, being collected from the rocks and dried in the sun, is exported to China, where it is an article of food.
Vegetable productions of the island considered as articles of commerce.

Pepper.—Cultivation of Pepper.—Camphor.—Benzoin.—Cassia, &c.

Of those productions of Sumatra, which are regarded as articles of commerce, the most important and most abundant is pepper. This is the object of the East India Company’s trade thither, and this alone it keeps in its own hands; its servants, and merchants under its protection, being free to deal in every other commodity.

Many of the princes or chiefs in different parts of the island having invited the English to form settlements in their respective districts, factories were accordingly established, and a permanency and regularity thereby given to the trade, which was very uncertain whilst it depended upon the success of occasional voyages to the coast; disappointments ensuing not only from failure of adequate quantities of pepper to furnish cargoes when required, but also from the caprices and chicanery of the chiefs with whom the disposal of it lay, the motives of whose conduct could not be understood by those who were unacquainted with the language and manners of the people. These inconveniencies were obviated when the agents of the Company were enabled, by their residence on the spot, to obtain an influence in the country, to inspect the state of the plantations, secure the collection of the produce, and make an estimate of the tonnage necessary for its conveyance to Europe.

In order to bind the chiefs to the observance of their original promises and professions, and to establish a plausible and legal claim, in opposition to the attempts of rival European powers to interfere in the trade of the same country, written contracts, attended with much form and solemnity, were entered into with the former; by which they engaged to oblige all their dependants to cultivate pepper, and to secure to us the exclusive purchase of it; in return for which they were to be protected from
from their enemies, supported in the rights of sovereignty, and to be paid a certain allowance or custom, on the produce of their respective territories.

The price for many years paid to the cultivators for their produce, was ten Spanish dollars or fifty shillings per bahar of five hundred weight or five hundred and sixty pounds. About the year 1780, with a view to their encouragement and the increase of investment, as it is termed, the sum was augmented to fifteen dollars. To this cost is to be added the custom above-mentioned, varying in different districts according to specific agreements, but amounting in general to one dollar and an half, or two dollars on each bahar, which is distributed amongst the chiefs at an annual entertainment; and presents are made at the same time to planters who have distinguished themselves by their industry. This low price, at which the natives submit to cultivate the plantations, affording to each man an income of not more than from eight to twelve dollars yearly, and the undisturbed monopoly we have so long possessed of the trade, from near Indrapura northward to Flat Point southward, are doubtless in a principal degree to be attributed to the peculiar manner in which this part of the island is shut up, by the surfs which prevail along the south-west coast, from communication with strangers, whose competition would naturally produce the effect of enhancing the price of the commodity. The general want of anchorage too, for so many leagues to the northward of the Straits of Sunda, has in all ages deterred the Chinese and other eastern merchants from attempting to establish an intercourse, that must be attended with imminent risk to unskilful navigators; indeed, I understand it to be a tradition among the natives who border on the sea-coast, that it is not many hundred years since these parts began to be inhabited, and they speak of their descent as derived from the more inland country. Thus it appears that those natural obstructions, which we are used to lament as the greatest detriment to our trade, are in fact advantages to which it in a great measure owes its existence. In the northern countries of the island, where the people are numerous and their ports good, they are found to be more independent also, and refuse to cultivate plantations upon any other terms than those on which they can deal with private traders.
In the cultivation of pepper (piper nigrum, L.) the first circumstance that claims attention, and on which the success materially depends, is the choice of a proper site for the plantation. A preference is usually given to level ground lying along the banks of rivers or rivulets, provided they are not so low as to be inundated, both on account of the vegetable mould commonly found there, and the convenience of water-carriage for the produce. Declivities, unless very gentle, are to be avoided, because the soil loosened by culture, is liable in such situations to be washed away by heavy rains. When these plains, however, are naked, or covered with long grass only, they will not be found to answer without the assistance of the plough and of manure; their fertility being exhausted by exposure to the sun. How far the returns in general might be increased by the introduction of these improvements in agriculture I cannot take upon me to determine; but I fear, that from the natural indolence of the natives, and their want of zeal in the business of pepper-planting, occasioned by the smallness of the advantage it yields to them, they will never be prevailed upon to take more pains than they now do. The planters, therefore, depending more upon the natural qualities of the soil than on any advantage it might receive from their cultivation, find none to suit their purpose better than those spots which, having been covered with old woods and long fertilized by decaying foliage and trunks, have recently been cleared for ladangs or padi fields, in the manner already described; where it was also observed, that being allured by the certainty of abundant produce from a virgin soil, and having land for the most part at will, they renew their toil annually, and desert the ground so laboriously prepared, after occupying it for one, or at the furthest for two, seasons. Such are the most usual situations chosen for the pepper plantations (kabūn) or gardens, as they are termed; but, independently of the culture of rice, land is very frequently cleared for the pepper in the first instance, by felling and burning the trees.

The ground is then marked out in form of a regular square or oblong, S 2 with

---

1 See Remarks on the Species of Pepper (and on its Cultivation) at Prince of Wales Island, by Dr. William Hunter, in the Asiat. Res. Vol. IX. p. 383.
with intersections throughout, at the distance of six feet, (being equal to five cubits of the measure of the country) the intended interval between the plants, of which there are commonly either one thousand or five hundred in each garden; the former number being required from those who are heads of families (their wives and children assisting them in their work), and the latter from single men. Industrious or opulent persons sometimes have gardens of two or three thousand vines. A border twelve feet in width, within which limit no tree is suffered to grow, surrounds each garden, and it is commonly separated from others by a row of shrubs or irregular hedge. Where the nature of the country admits of it, the whole or greater part of the gardens of a dusun or village lie adjacent to each other, both for the convenience of mutual assistance in labour, and mutual protection from wild beasts; single gardens being often abandoned from apprehension of their ravages, and where the owner has been killed in such a situation, none will venture to replace him. After lining out the ground, and marking the intersections by slight stakes, the next business is to plant the trees that are to become props to the pepper, as the Romans planted elms, and the modern Italians more commonly plant poplars and mulberries, for their grape-vines. These are cuttings of the chingkariang (erythrina corallodendron), usually called chinkareens, put into the ground about a span deep, sufficiently early to allow time for a shoot to be strong enough to support the young pepper-plant when it comes to twine about it. The cuttings are commonly two feet in length, but sometimes a preference is given to the length of six feet, and the vine is then planted as soon as the chinkareen has taken root: but the principal objections to this method are, that in such state they are very liable to fail and require renewal, to the prejudice of the garden; and that their shoots are not so vigorous as those of the short cuttings, frequently growing crooked, or in a lateral instead of a perpendicular direction. The circumstances which render the chinkareen particularly proper for this use, are its readiness and quickness of growth, even after the cuttings have been kept some time in bundles, if

Vegetating props.

---

A. It is a common and useful practice to place these bundles of cuttings in water about two inches deep, and afterwards to reject such of them as in that state do not shew signs of vegetation.
if put into the ground with the first rains; and the little thorns with which it is armed enabling the vine to take a firmer hold. They are distinguished into two sorts, the white and red, not from the colour of the flowers (as might be supposed) for both are red, but from the tender shoots of the one being whitish, and of the other being of a reddish hue. The bark of the former is of a pale ash colour, of the latter brown; the former is sweet, and the food of elephants, for which reason it is not much used in parts frequented by those animals; the latter is bitter and unpalatable to them; but they are not deterred by the short prickles which are common to the branches of both sorts.

Trial has frequently been made of other trees, and particularly of the banigkudu or manigkudu (morinda citrifolia), but none have been found to answer so well for these vegetating props. It has been doubted, indeed, whether the growth and produce of the pepper-vine are not considerably injured by the chinkareen, which may rob it of its proper nourishment by exhausting the earth; and on this principle, in other of the eastern islands, (Borneo, for instance) the vine is supported by poles, in the manner of hops in England. Yet it is by no means clear to me, that the Sumatran method is so disadvantageous in the comparison as it may seem; for, as the pepper-plant lasts many years, whilst the poles, exposed to sun and rain, and loaded with a heavy weight, cannot be supposed to continue sound above two seasons, there must be a frequent renewal, which, notwithstanding the utmost care, must lacerate and often destroy the vines. It is probable also that the shelter from the violence of the sun’s rays afforded by the branches of the vegetating prop, and which, during the dry monsoon, is of the utmost consequence, may counterbalance the injury occasioned by their roots; not to insist on the opinion of a celebrated writer, that trees, acting as siphons, derive from the air and transmit to the earth as much of the principle of vegetation, as is expended in their nourishment.

When the most promising shoot of the chinkareen reserved for rearing has attained the height of twelve to fifteen feet (which latter it is not to exceed), or in the second year of its growth, it must be headed or topped;
The pepper-vine is, in its own climate, a hardy plant, growing readily from cuttings or layers, rising in several knotted stems, twining round any neighbouring support, and adhering to it by fibres that shoot from every joint at intervals of six to ten inches, and from which it probably derives a share of its nourishment. If suffered to run along the ground, these fibres would become roots; but in this case (like the ivy) it would never exhibit any appearance of fructification, the prop being necessary for encouraging it to throw out its bearing shoots. It climbs to the height of twenty or twenty-five feet, but thrives best when restrained to twelve or fifteen, as in the former case the lower part of the vine bears neither leaves nor fruit, whilst in the latter it produces both from within a foot of the ground. The stalk soon becomes ligneous, and in time acquires considerable thickness. The leaves are of a deep green and glossy surface, heart-shaped, pointed, not pungent to the taste, and have but little smell. The branches are short and brittle, not projecting above two feet from the stem, and separating readily at the joints. The blossom is small and white; the fruit round, green when young and full-grown, and turning to a bright red when ripe and in perfection. It grows abundantly from all the branches, in long, small clusters of twenty to fifty grains, somewhat resembling bunches of currants, but with this difference, that every grain adheres to the common stalk, which occasions the cluster of pepper to be more compact, and it is also less pliant.

The usual mode of propagating the pepper is by cuttings, a foot or two in length, of the horizontal shoots that run along the ground from the foot of the old vines (called lado sülür), and one or two of these are planted...
ed within a few inches of the young chinkareen, at the same time with it, if of the long kind, or six months after, if of the short kind, as before described. Some, indeed, prefer an interval of twelve months; as in good soil the luxuriancy of the vine will often overpower and bear down the prop, if it has not first acquired competent strength. In such soil the vine rises two or three feet in the course of the first year, and four or five more in the second, by which time, or between the second and third year of its growth, it begins to shew its blossom (be-gagang), if in fact it can be called such, being nothing more than the germ of the future bunch of fruit, of a light straw colour, darkening to green as the fruit forms. These germs or blossoms are liable to fall untimely (gugur) in very dry weather, or to be shaken off in high winds (although from this accident the gardens are in general well sheltered by the surrounding woods), when, after the fairest promise, the crop fails. In the rainy weather that succeeds the first appearance of the fruit, the whole vine is loosened from the chinkareen, and turned down again into the earth, a hole being dug to receive it, in which it is laid circularly or coiled, leaving only the extremity above ground, at the foot of the chinkareen, which it now reascends with redoubled vigour, attaining in the following season the height of eight or ten feet, and bearing a full crop of fruit. There is said to be a great nicety in hitting the exact time proper for this operation of turning down; for if it be done too soon, the vines have been known not to bear till the third year, like fresh plants; and on the other hand, the produce is ultimately retarded, when they omit to turn them down until after the first fruit has been gathered; to which, avarice of present, at the expense of future advantage, sometimes inclines the owners. It is not very material how many stems the vine may have in its first growth, but now one only, if strong, or two at the most, should be suffered to rise and cling to the prop: more would be superfluous and only weaken the whole. The supernumerary shoots, however, are usefully employed, being either conducted through narrow trenches to adjacent chinkareens, whose vines have failed, or taken off at the root and transplanted to others more distant, where, coiled round and buried as the former, they rise with the same vigour, and the garden is completed of uniform growth, although many of its original vines have not succeeded.
ceeded. With these off-sets or layers (called aniggogor and tettas) new gardens may be at once formed; the necessary chinkareens being previously planted, and of sufficient growth to receive them.

This practice of turning down the vines, which appears singular, but certainly contributes to the duration as well as strength of the plants, may yet amount to nothing more than a substitute for transplantation. Our people observing that vegetables often fail to thrive when permitted to grow up in the same beds where they were first set or sown, find it advantageous to remove them, at a certain period of their growth, to fresh situations. The Sumatrans observing the same failure, have had recourse to an expedient nearly similar in its principle, but effected in a different and perhaps more judicious mode.

In order to lighten the labour of the cultivator, who has also the indispensable task of raising grain for himself and his family, it is a common practice, and not attended with any detriment to the gardens, to sow padi in the ground in which the chinkareens have been planted, and when this has become about six inches high, to plant the cuttings of the vines, suffering the shoots to creep along the ground until the crop has been taken off; when they are trained to the chinkareens; the shade of the corn being thought favourable to the young plants.

The vines, as has been observed, generally begin to bear in the course of the third year from the time of planting, but the produce is retarded for one or two seasons by the process just described; after which it increases annually for three years, when the garden (about the seventh or eighth year) is esteemed in its prime, or at its utmost produce; which state it maintains, according to the quality of the soil, from one to four years, when it gradually declines, for about the same period, until it is no longer worth the labour of keeping it in order. From some, in good ground, fruit has been gathered at the age of twenty years; but such instances are uncommon. On the first appearance of decline it should be renewed, as it is termed; but, to speak more properly, another garden should be planted to succeed it, which will begin to bear before the old one ceases.
The vine having acquired its full growth, and being limited by the height of the chinkareen, sometimes grows bushy and overhangs at top, which, being prejudicial to the lower parts, must be corrected by pruning or thinning the top branches, and this is done commonly by hand, as they break readily at every joint. Suckers too, or superfluous side-shoots (charang), which spring luxuriantly, are to be plucked away. The ground of the garden must be kept perfectly clear of weeds, shrubs, and whatever might injure or tend to choke the plants. During the hot months of June, July, and August, the finer kinds of grass may be permitted to cover the ground, as it contributes to mitigate the effects of the sun's power, and preserves for a longer time the dews, which at that season fall copiously; but the rank species, called lalang, being particularly difficult to eradicate, should not be suffered to fix itself, if it can be avoided. As the vines increase in size and strength less attention to the ground is required, and especially as their shade tends to check the growth of weeds. In lopping the branches of the chinkareens preparatory to the rains, some dexterity is required that they may fall clear of the vine, and the business is performed with a sharp prang or bill that generally separates at one stroke the light, pithy substance of the bough. For this purpose, as well as that of gathering the fruit, light, triangular ladders made of bamboo are employed. As soon as any of the berries or corns redden, the bunch is reckoned fit for gathering, the remainder being then generally full-grown, although green; nor would it answer to wait for the whole to change colour, as the most mature would drop off. It is collected in small baskets slung over the shoulder, and with the assistance of the women and children conveyed to a smooth, level spot of clean, hard ground, near the garden or the village, where it is spread, sometimes upon mats, to dry in the sun; but exposed at the same time to the vicissitudes of the weather, which are not much regarded, nor thought to injure it. In this situation it becomes black and shrivelled, as we see it in Europe, and as it dries is hand-rubbed occasionally to separate the grains from the stalk. It is then winnowed in large, round, shallow sieves, called nyiru, and put in large vessels made of bark (kulitkayu) under their houses, until the whole of the crop is gathered, or a sufficient quantity for carrying (usually by water) to the European factory or gadong, at the mouth of the river. That which has been gathered
thered at the properest stage of maturity will shrivel the least; but, if
plucked too soon, it will in a short time, by removal from place to place,
become mere dust. Of this defect trial may be made by the hand; but
as light pepper may have been mixed with the sound, it becomes neces-
sary that the whole should be garbled at the scale by machines con-
structed for the purpose. Pepper that has fallen to the ground overripe,
and been gathered from thence, will be known by being stripped of its
outer coat, and in that state is an inferior kind of white pepper.

White pepper. This was for centuries supposed in Europe to be the produce of a dif-
ferent plant, and to possess qualities superior to those of the common
black pepper; and accordingly it sold at a considerably higher price.
But it has lost in some measure that advantage since it has been known
that the secret depended merely upon the art of blanching the grains of
the other sort, by depriving it of the exterior pellicle. For this purpose
the rippest red grains are picked out and put in baskets to steep, either in
running water (which is preferred), in pits dug for the occasion, near
the banks of rivers, or in stagnant pools. Sometimes it is only buried in
the ground. In any of these situations it swells, and, in the course of a
week or ten days, bursts its tegument, from which it is afterwards care-
fully separated by drying in the sun, rubbing between the hands, and
winnowing. It has been much disputed, and is still undetermined, to
which sort the preference ought to be given. The white pepper has this
obvious recommendation, that it can be made of no other than the best
and soundest grains, taken at their most perfect stage of maturity: but,
on the other hand, it is argued, that by being suffered to remain the ne-
cessary time in water, its strength must be considerably diminished; and
that the outer husk, which is lost by the process, has a peculiar flavour
distinct from that of the heart, and though not so pungent, more aromat-
ic. For the white pepper the planter receives the fourth part of a dollar,
or fifteen-pence, per bamboo or gallon measure, equal to about six pounds
weight. At the sales in England the prices are at this time in the pro-
portion of seventeen to ten or eleven, and the quantity imported has for
some years been inconsiderable.
at right angles with each other, their symmetrical appearance is very beautiful, and rendered more striking by the contrast they exhibit to the wild scenes of nature which surround them. In highly cultivated countries, such as England, where landed property is all lined out, and bounded and intersected with walls and hedges, we endeavour to give our gardens and pleasure grounds the charm of variety and novelty, by imitating the wildness of nature, in studied irregularities. Winding walks, hanging woods, craggy rocks, falls of water, are all looked upon as improvements; and the stately avenues, the canals, and rectangular lawns of our ancestors, which afforded the beauty of contrast, in ruder times, are now exploded. This difference of taste is not merely the effect of caprice, nor entirely of refinement, but results from the change of circumstances. A man who should attempt to exhibit in Sumatra, the modern, or irregular style of laying out grounds, would attract but little attention, as the unimproved scenes adjoining on every side, would probably eclipse his labours. Could he, on the contrary, produce, amidst its magnificent wilds, one of those antiquated parterres, with its canals and fountains, whose precision he has learned to despise, his work would create admiration and delight. A pepper garden cultivated in England, would not, in point of external appearance, be considered as an object of extraordinary beauty, and would be particularly found fault with for its uniformity; yet, in Sumatra, I never entered one, after travelling many miles, as is usually the case, through the woods, that I did not find myself affected with a strong sensation of pleasure. Perhaps the simple view of human industry, so scantily presented in that island, might contribute to this pleasure, by awakening those social feelings that nature has inspired us with, and which make our breasts glow on the perception of whatever indicates the prosperity and happiness of our fellow-creatures.

Once in every year, a survey of all the pepper-plantations is taken by the Company’s European servants, resident at the various settlements, in the neighbourhood of which that article is cultivated. The number of vines in each particular garden is counted; accurate observation is made of its state and condition; orders are given, where necessary, for further care, for completion of stipulated quantity, renewals, changes of
of situation for better soil; and rewards and punishments are distributed to the planters, as they appear, from the degree of their industry or remissness, deserving of either. Minutes of all these are entered in the survey-book, which, beside giving present information to the chief, and to the governor and council, to whom a copy is transmitted, serves as a guide and check for the survey of the succeeding year. An abstract of the form of the book is as follows. It is divided into sundry columns, containing the name of the village; the names of the planters; the number of chinkareens planted; the number of vines just planted; of young vines, not in a bearing state, three classes or years; of young vines in a bearing state, three classes; of vines in prime; of those on decline; of those that are old, but still productive; the total number; and lastly the quantity of pepper received during the year. A space is left for occasional remarks, and at the conclusion is subjoined a comparison of the totals of each column, for the whole district or residency, with those of the preceding year. This business the reader will perceive to be attended with considerable trouble, exclusive of the actual fatigue of the surveys, which, from the nature of the country, must necessarily be performed on foot, in a climate not very favourable to such excursions. The journeys in few places can be performed in less than a month, and often require a much longer time.

The arrival of the Company's Resident at each dusun is considered as a period of festivity. The chief, together with the principal inhabitants, entertain him and his attendants with rustic hospitality, and when he retires to rest, his slumbers are soothed, or interrupted, by the songs of young females, who never fail to pay this compliment to the respected guest; and receive in return some trilling ornamental and useful presents (such as looking-glasses, fans, and needles) at his departure.

Succession of gardens.  The inhabitants, by the original contracts of the head men with the Company, are obliged to plant a certain number of vines; each family one thousand, and each young unmarried man five hundred; and, in order to keep up the succession of produce, so soon as their gardens attain to their prime state, they are ordered to prepare others, that they may be-
gin to bear as the old ones fall off; but as this can seldom be enforced, till the decline becomes evident, and as young gardens are liable to various accidents which older ones are exempt from, the succession is rendered incomplete, and the consequence is, that the annual produce of each district fluctuates, and is greater or less, in the proportion of the quantity of bearing vines to the whole number. To enter minutely into the detail of this business, will not afford much information or entertainment to the generality of readers, who will, however, be surprised to hear that pepper-planting, though scarcely an art, so little skill appears to be employed in its cultivation, has nevertheless been rendered an abstruse science, by the investigations which able men have bestowed upon the subject. These took their rise from censures conveyed for supposed mismanagement, when the investment, or annual provision of pepper, decreased in comparison with preceding years, and which was not satisfactorily accounted for by unfavourable seasons. To obviate such charges, it became necessary for those who superintended the business, to pay attention to, and explain the efficient causes which unavoidably occasioned this fluctuation, and to establish general principles of calculation, by which to determine at any time, the probable future produce of the different residencies. These will depend upon a knowledge of the medium produce of a determinate number of vines, and the medium number to which this produce is to be applied; both of which are to be ascertained only from a comprehensive view of the subject, and a nice discrimination. Nothing general can be determined from detached instances. It is not the produce of one particular plantation in one particular stage of bearing, and in one particular season; but the mean produce of all the various classes of bearing vines collectively, drawn from the experience of several years, that can alone be depended on in calculations of this nature. So in regard to the medium number of vines presumed to exist at any residency in a future year, to which the medium produce of a certain number, one thousand, for instance, is to be applied, the quantity of young vines of the first, second, and third year, must not be indiscriminately advanced, in their whole extent, to the next annual stage, but a judicious allowance, founded on experience, must be made, for the accidents to which, in spite of a resident's utmost care, they will be exposed. Some are lost by neglect or death of
the owner; some are destroyed by inundations, others by elephants and wild buffaloes, and some by unfavourable seasons and from these several considerations, the number of vines will ever be found considerably decreased, by the time they have arrived at a bearing state. Another important object of consideration, in these matters, is the comparative state of a residency at any particular period, with what may be justly considered as its medium state. There must exist a determinate proportion between any number of bearing vines, and such a number of young as are necessary to replace them when they go off and keep up a regular succession. This will depend in general upon the length of time before they reach a bearing state, and during which they afterwards continue in it. If this certain proportion happens at any time to be disturbed, the produce must become irregular. Thus, if at any period, the number of bearing vines shall be found to exceed their just proportion to the total number, the produce, at such period, is to be considered as above the mean, and a subsequent decrease may with certainty be predicted, and vice versa. If then this proportion can be known, and the state of population in a residency ascertained, it becomes easy to determine the true medium number of bearing vines in that residency.

There are, agreeably to the form of the survey book, eleven stages or classes of vines, each advanced one year. Of these classes, six are bearing, and five young. If, therefore, the gardens were not liable to accidents, but passed on from column to column undiminished, the true proportion of the bearing vines to the young would be as six to five, or to the total, as six to eleven. But the various contingences above hinted at, must tend to reduce this proportion; while, on the other hand, if any of the gardens should continue longer than is necessary to pass through all the stages on the survey-book, or should remain more than one year in a prime state, these circumstances would tend to increase the proportion. What then is the true medium proportion, can only be determined from experience, and by comparing the state of a residency at various successive periods. In order to ascertain this point, a very ingenious gentleman, and able servant of the East India Company, to whom

* Mr. John Crisp.
SUMATRA.

whom I am indebted for the most part of what I have laid before the reader on this part of the subject, drew out, in the year 1777, a general comparative view of Manna residency, from the surveys of twelve years, annexing the produce of each year. From the statement it appeared, that the proportion of the bearing vines to the whole number, in that district, was no more than 5 to 11, instead of 6 to 11, which would be the proportion, if not reduced by accidents; and further, that when the whole produce of the twelve years was diffused over the whole number of bearing vines during that period, the produce of one thousand vines came out to be four hundred and fifty-three pounds, which must therefore be estimated as the medium produce of that residency. The same principle of calculation being applied to the other residencies, it appeared, that the mean annual produce of one thousand vines, in all the various stages of bearing, taken collectively throughout the country, deduced from the experience of twelve years, was four hundred and four pounds. It likewise became evident from the statements drawn out by that gentleman, that the medium annual produce of the Company’s settlements on the west coast of Sumatra, ought to be estimated at twelve hundred tons, of sixteen hundred weight; which is corroborated by an average of the actual receipts for any considerable number of years.

Thus much will be sufficient to give the reader an idea of pepper-planting as a kind of science. How far, in a commercial light, this produce answers the Company’s views in supporting the settlements, is foreign from my purpose to discuss, though it is a subject on which not a little might be said. It is the history of the island, and its inhabitants, and not of the European interests, that I attempt to lay before the public.

The natives distinguish three species of pepper, which are called at different places by different names. At Laye, in the Rejang country, they term them lado kawur, lado manna, and lado jambi, from the parts where each sort is supposed to prevail, or from whence it was first brought to them. The lado kawur, or Lampong pepper, is the strongest plant, and bears the largest leaf and fruit; is slower in coming to perfection
perfection than the second, but of much longer duration. The leaf and fruit of the *lado manna* are somewhat smaller, and it has this peculiarity, that it bears soon and in large quantities, but seldom passes the third or fourth year's crop. The *jambi*, which has deservedly fallen into disrepute, is of the smallest leaf and fruit, very short lived, and not without difficulty trained to the chinkareen. In some places to the southward they distinguish two kinds only, *lado sudul* and *lado jambi*. *Lado sudur* and *lado aṅggor* are not distinctions of species; the former denoting the cuttings of young creeping shoots commonly planted, in opposition to the latter, which is the term for planting by layers.

The season of the pepper-vines bearing, as well as that of most other fruits-trees on Sumatra, is subject to great irregularities, owing, perhaps, to the uncertainty of the monsoons, which are not there so strictly periodical, as on the western side of India. Generally speaking, however, the pepper produces two crops in the year; one called the greater crop (*pupul agung*) between the months of October and March; the other called the lesser or half crop (*buah sello*) between the months of April and September, which is small in proportion as the former has been considerable, and *vice versa*. Sometimes, in particular districts, they will be employed in gathering it in small quantities, during the whole year round, whilst, perhaps, in others, the produce of that year is confined to one crop; for although the regular period between the appearance of the blossom and maturity is about four months, the whole does not ripen at once, and blossoms are frequently found on the same vine with green and ripe fruit. In Laye residency, the principal harvest of pepper, in the year 1766, was gathered between the months of February and May; in 1767 and 1768, about September and October; in 1778, between June and August; and for the four succeeding years was seldom received earlier than November and December. Long continued droughts, which sometimes happen, stop the vegetation of the vines, and retard the produce. This was particularly experienced in the year 1775, when, for a period of about eight months, scarcely a shower of rain fell to moisten the earth. The vines were deprived of their foliage; many gardens perished, and a general destruction was expected. But this apparent calamity was attended with a consequence not foreseen, though analogous
to the usual operations of nature in that climate. The natives, when they would force a tree that is backward, to produce fruit, strip it of its leaves, by which means the nutritive juices are reserved for that more important use, and the blossoms soon begin to shew themselves in abundance. A similar effect was displayed in the pepper gardens, by the inclemency of the season. The vines, as soon as the rains began to descend, threw out blossoms in a profusion unknown before; old gardens, which had been unprolific for two or three years, began to bear; and accordingly the crop of 1776-7 considerably surpassed that of many preceding years.

The pepper is mostly brought down from the country on rafts (rakit), which are sometimes composed of rough timbers, but usually of large bamboos, with a platform of split bamboos, to keep the cargo dry. They are steered at both head and stern, in the more rapid rivers, with a kind of rudder, or scull rather, having a broad blade, fixed in a fork or crutch. Those who steer are obliged to exert the whole strength of the body, in those places especially where the fall of water is steep, and the course winding; but the purchase of the scull is of so great power, that they can move the raft bodily across the river, when both ends are acted upon at the same time. But, notwithstanding their great dexterity, and their judgment in chusing the channel, they are liable to meet with obstruction in large trees and rocks, which, from the violence of the stream, occasion their rafts to be overset, and sometimes dashed to pieces.

It is a generally received opinion, that pepper does not sustain any damage by an immersion in sea water; a circumstance that attends, perhaps, a fourth part of the whole quantity shipped from the coast. The surf, through which it is carried in an open boat, called a sampan longchore, renders such accidents unavoidable. This boat, which carries one or two tons, being hauled up on the beach, and there loaded, is shoved off, with a few people in it, by a number collected for that purpose, who watch the opportunity of a lull, or temporary intermission of the swell. A tambanigan, or long narrow vessel, built to contain from ten to twenty tons, (peculiar to the southern part of the coast) lies at anchor without, to receive the cargoes from the sampans. At many places,
where the *kweallas*, or mouths of the rivers, are tolerably practicable, the pepper is sent out at once in the *tambangans* over the bar; but this, owing to the common shallowness of the water, and violence of the surfs, is attended with considerable risk. Thus the pepper is conveyed, either to the warehouses at the head-settlement, or to the ship from Europe lying there to receive it. About one-third part of the quantity of black pepper collected, but none of the white, is annually sent to China. Of the extent and circumstances of the trade in pepper carried on by private merchants (chiefly American) at the northern ports of Nalabu, Susu, and Mukki, where it is managed by the subjects of Achin, I have not any accurate information, and only know that it has increased considerably during the last twelve years.

It is well known with what jealousy and rigour the Batavian government has guarded against the transplantation of the trees producing nutmegs and cloves from the islands of Banda and Amboina to other parts of India. To elude its vigilance many attempts have been made by the English, who considered Sumatra to be well adapted, from its local circumstances, to the cultivation of these valuable spices; but all proved ineffectual, until the reduction of the eastern settlements in 1796, afforded the wished for opportunity, which was eagerly seized by Mr. Robert Broff, at that period chief of the Residency of Fort Marlborough. As the culture is now likely to become of importance to the trade of this country, and the history of its introduction may hereafter be thought interesting, I shall give it in Mr. Broff's own words. "The acquisition of the nutmeg and clove plants became an object of my solicitude the moment I received by Capt. Newcombe, of his Majesty's ship Orpheus, the news of the surrender of the islands where they are produced; being convinced, from the information I had received, that the country in the neighbourhood of Bencoolen, situated as it is in the same latitude with the Moluccas, exposed to the same periodical winds, and possessing the same kind of soil, would prove congenial to their culture. Under this impression I suggested to the other members of the Board the expediency of freighting a vessel for the two-fold purpose of sending supplies to the forces at Amboina, for which they were in distress, and of bringing in return as many spice-plants as could be conveniently stowed. The proposition

**Nutmegs and cloves.**
proposition was acceded to, and a vessel, of which I was the principal owner (no other could be obtained) was accordingly dispatched in July, 1806; but the plan was unfortunately frustrated by the imprudent conduct of a person on the civil establishment, to whom the execution was entrusted. Soon afterwards, however, I had the good fortune to be more successful, in an application I made to Capt. Hugh Moore, who commanded the Phœnix country ship, to undertake the importation; stipulating with him to pay a certain sum for every healthy plant he should deliver. Complete success attended the measure: he returned in July, 1798, and I had the satisfaction of planting myself, and distributing for that purpose, a number of young nutmeg and a few clove trees, in the districts of Bencoolen and Sillebar, and other more distant spots, in order to ascertain from experience the situations best adapted to their growth. I particularly delivered to Mr. Charles Campbell, botanist, a portion to be under his own immediate inspection; and another to Mr. Edward Coles, this gentleman having in his service a family who were natives of a spice island, and had been used to the cultivation. When I quitted the coast in January, 1799, I had the gratification of witnessing the prosperous state of the plantations, and of receiving information from the quarters where they had been distributed, of their thriving luxuriantly; and since my arrival in England various letters have reached me, to the same effect. To the merit, therefore, of introducing this important article, and of forming regulations for its successful culture, I put in my exclusive claim; and am fully persuaded that if a liberal policy is adopted, it will become of the greatest commercial advantage to the Company and to the nation.”

Further light will be thrown upon this subject, and the progress of the cultivation, by the following extract of a letter to me from Mr. Campbell, dated in November, 1803. “Early in the year 1798, Mr. Broff, to whom the highest praise is due for his enterprising and considerative scheme of procuring the spice trees from our newly-conquered islands (after experiencing much disappointment and want of support) overcame every obstacle, and we received, through the agency of Mr. Jones, commercial resident at Amboina, five or six hundred nutmeg plants, with about fifty cloves; but these latter were not in a vigorous state. They
were distributed, and put generally under my inspection. Their culture
was attended with various success, but Mr. Coles, from the situation of
his farm, near Silebar River, but not too close to the sea-shore, and
from, I believe, bestowing more personal attention than any of us, has
outstripped his competitors. Some trees which I planted as far inland
as the Sugar-loaf Mountain, blossomed with his, but the fruit was first
perfected in his ground. The plants were dispatched from Amboina
in March, 1798, just bursting from the shell, and two months ago I
plucked the perfect fruit, specimens of which I now send you; being a
period of five years and nine months only; whereas in their native land
eight years at least are commonly allowed. Having early remarked the
great promise of the trees, I tried by every means in my power to interest
the Bengal government in our views, and at length, by the assistance of
Dr. Roxburgh, I succeeded. A few months ago his son arrived here
from Amboina, with twenty-two thousand nutmeg plants, and upwards
of six thousand cloves, which are already in my nurseries, and flourishing
like those which preceded them. About the time the nutmegs
fruited, one clove tree flowered. Only three of the original importation
had survived their transit and the accidents attending their planting out.
Its buds are now filling, and I hope to transmit specimens of them also.
The Malay chiefs have eagerly engaged in the cultivation of their respec-
tive shares. I have retained eight thousand nutmegs as a plantation,
from which the fruit may hereafter be disseminated. Every kind of soil,
and every variety of situation, has been tried. The cloves are not yet
widely dispersed, for being a tender plant, I chuse to have them under
my own eye.” Since the death of Mr. Campbell, Mr. Roxburgh has
been appointed to the superintendence, and the latest accounts from
thence justify the sanguine expectations formed of the ultimate impor-
tance of the trade; there being at that period upwards of twenty thou-
sand nutmeg trees in full bearing, capable of yielding annually two hun-
dred thousand pounds weight of nutmegs, and fifty thousand pounds of
mace. The clove plants have proved more delicate, but the quality of
their spice equal to any produced in the Moluccas. It is understood,
that the Company has declined the monopoly of the trade, and left the
cultivation to individual exertion; directing, however, that its own im-
mediate plantations be kept up by the labour of convicts from Bengal,
and reserving to itself an export duty of ten per cent. on the value of the spices.

Among the valuable productions of the island as articles of commerce, a conspicuous place belongs to the camphor.

This peculiar substance, called by the natives *kapūr-bārus,* and distinguished by the epithet of native camphor from another sort which shall be mentioned hereafter, is a drug for which Sumatra and Borneo have been celebrated from the earliest times, and with the virtues of which the Arabian physicians appear to have been acquainted. Chemists formerly entertained opinions extremely discordant in regard to the nature and the properties of camphor; and even at this day they seem to be but imperfectly known. It is considered, however, as a sedative and powerful diaphoretic; but my province is to mention such particulars of its history as have come within my knowledge, leaving to others to investigate its most beneficial uses.

The tree is a native of the northern parts of the island only, not being found to the southward of the line, nor yet beyond the third degree of N. latitude. It grows, without cultivation, in the woods lying near to the sea-coast, and is equal in height and bulk to the largest timber trees, being frequently found upwards of fifteen feet in circumference. For carpenters' purposes the wood is in much esteem, being easy to work, light, durable, and not liable to be injured by insects, particularly by the *kumbang,* a species of the bee, whose destructive perforations have been already mentioned; but is also said to be more affected than most others by the changes of the atmosphere. The leaf is small, of a roundish oval, the fibres running straight and parallel to each other, and terminates in a remarkably long and slender point. The flower has not yet been brought to England. The fruit is described by C. F. Gaertner (De Seminibus,

---

* The word *kapūr* appears to be derived from the Sanskrit *karpūra,* and the Arabic and Persian *kāfūr* (from whence our *camphor,* to have been adopted from the language of the country where the article is produced. *Bārus* is the name of a place in Sumatra.
Seminibus, Vol. III. p. 49. tab. clxxxvi.) by the name of *Dryobalanops aromatic*ica, from specimens in the collection of Sir Joseph Banks; but he has unaccountably mistaken it for the cinnamon tree, and spoken of it as a native of Ceylon. It is also described, from the same specimens, by M. Corrée de (Serra Annales du Muséum d' Histoire Naturelle, Tom. X. p. 159. pl. 8.) by the name of *Pterigium teres*; without any reference whatever to the nature of the tree as yielding this valuable drug. A beautiful engraving of its very peculiar foliage has been made under the direction of Mr. A. B. Lambert.

The camphor is found in the concrete state in which we see it, in natural fissures or crevices of the wood, but does not exhibit any exterior appearance by which its existence can be previously ascertained, and the persons whose employment it is to collect it, usually cut down a number of trees, almost at random, before they find one that contains a sufficient quantity to repay their labour, although always assisted in their research by a professional conjurer, whose skill must be chiefly employed in concealing or accounting for his own mistakes. It is said, that not a tenth part of the number felled is productive either of camphor or of camphor-oil (*ménia*kapur), although the latter is less rare; and that parties of men are sometimes engaged for two or three months together in the forests, with very precarious success. This scarcity tends to enhance the price. The tree, when cut down, is divided transversely into several blocks, and these again are split with wedges into small pieces, from the interstices of which the camphor, if any there be, is extracted. That which comes away readily in large flakes, almost transparent, is esteemed the prime sort or head; the smaller, clean pieces are considered as belly, and the minute particles, chiefly scraped from the wood, and often mixed with it, are called foot; according to the customary terms adopted in the assortment of drugs. The mode of separating it from these and other impurities, is by steeping and washing it in water, and sometimes with the aid of soap. It is then passed through sieves or screens of different apertures, in order to make the assortment, so far as that depends upon the size of the grains; but much of the selection is also made by hand, and particular care is taken to distinguish from the more
more genuine kinds, that which is produced by an artificial concretion of the essential oil.

The inquiries I formerly made on the subject (not having been myself in the district where the tree grows) led me to believe with confidence that the oil, and the dry crystallized resin were not procured from the same individual tree; but in this I was first undeceived by Mr. R. Maidman, who, in June 1788, wrote to me from Tappanuli, where he was resident, to the following effect: "I beg your acceptance of a piece of camphor wood, the genuine quality of which I can answer for, being cut by one of my own people, who was employed in making charcoal, of which the best for smiths' work is made from this wood. On cutting deep into a pretty large tree, the fine oil suddenly gushed out, and was lost for want of a receiver. He felled the tree, and having split it, brought me three or four catties (four or five pounds) of the finest camphor I ever saw, and also this log, which is very rich. My reason for being thus particular is, that the country people have a method of pouring oil of inferior camphor trees into a log of wood that has natural cracks, and by exposing this to the sun every day for a week, it appears like genuine camphor; but is the worst sort." This coexistence of the two products has been since confirmed to me by others, and is particularly stated by Mr. Macdonald in his ingenious paper on certain "Natural Productions of Sumatra" published in the Asiatic Res. Vol. IV. Calcutta 1795. It seems probable on the whole, that as the tree advances in age, a greater proportion of this essential oil takes a concrete form, and it has been observed to me, that when the fresh oil has been allowed to stand and settle, a sediment of camphor is procured; but the subject requires further examination by well informed persons on the spot.

Head camphor is usually purchased from those who procure it, at the rate of six Spanish dollars the pound, or eight dollars the catty, and sells in the China market at Canton for nine to twelve dollars the pound, or twelve to fifteen hundred dollars the pekul of a hundred catties or one hundred thirty-three pounds and a third, avoirdupoise. When of superior quality it sells for two thousand dollars, and I have been
been assured, that some small, choice samples, have produced upwards, of thirty dollars per catty. It is estimated that the whole quantity annually brought down for sale, on the western side of the island, does not exceed fifty pekul. The trade is chiefly in the hands of the Chinese settled at Sinkell, who buy the article from the Battu people, and dispose of it to the Europeans and Chinese settlers.

It has been commonly supposed that the people of China or Japan prepare a factitious substance resembling native camphor, and impregnated with its virtues by the admixture of a small quantity of the genuine, which is sold to the Dutch factory for thirty or forty dollars the pekul, sent to Holland, and afterwards refined to the state in which we see it in our shops, where it is sold at eight to twelve shillings the pound. It appears, however, an extraordinary circumstance, that any article could possibly be so adulterated, bearing at the same time the likeness and retaining the sensible qualities of its original, as that the dealers should be enabled, with profit to themselves to re-sell it for the fiftieth part of the price they gave. But upon inquiry of an ingenious person long resident in China, I learned that the Japan camphor is by no means a factitious substance, but the genuine produce of a tree growing in abundance in the latter country, different in every character from that of Sumatra or Borneo, and well known to our botanists by the name of laurus camphora, L. He further informed me that the Chinese never mix the Sumatran camphor with that from Japan, but purchase the former for their own use, at the before-mentioned extravagant price, from an idea of its efficacy, probably superstitious, and export the latter as a drug not held in any particular estimation. Thus we buy the leaves of their tea-plant, at a high rate, and neglect herbs, the natives of our own soil, possessing perhaps equal virtues. It is known

* See Price Currents of the China trade. Camphor was purchased in Sumatra by Commodore Beaulieu, in 1622, at the rate of fifteen Sp. dol. for twenty eight ounces, which differs but little from the modern price. In the Trans. of the Society at Batavia, it appears that the camphor of Borneo sells in their market for 3200 rix dollars, and that of Japan for 50 rix dollars the pekul.
known also that the Japan camphor, termed factitious, will evaporate till it wholly disappears, and at all stages of its diminution retain its full proportion of strength; which does not seem the property of an adulterated or compounded body. Kæmpfer informs us that it is prepared from a decoction of the wood and roots of the tree, cut into small pieces; and the form of the lumps in which it is brought to us shews that it has undergone a process. The Sumatran sort, though doubtless from its extreme volatility it must be subject to decrease, does not lose any very sensible quantity from being kept, as I find from the experience of many years that it has been in my possession. It probably may not be very easy to ascertain its superiority over the other in the *materia medica*, not being brought for sale to this country, nor generally administered; but from a medical person who practised at Bencoolen, I learned that the usual dose he gave was from half a grain to one or two grains at the most. The oil, although hitherto of little importance as an article of commerce, is a valuable domestic medicine, and much used by the natives as well as Europeans, in cases of strains, swellings, and rheumatic pains; its particles, from their extreme subtilty, readily entering the pores. It undergoes no preparation, and is used in the state in which, upon incision, it has distilled from the tree. The *kayu putih* (melaleuca leucadendron) oil, which is somewhat better known in England, is obtained in the same manner; but to procure the *meniak kayu* or common wood-oil, used for preserving timber or boards exposed to the weather, from decay, and for boiling with dammar to pay the bottoms of ships and boats, the following method is practised. They make a transverse incision into the tree, to the depth of some inches, and then cut sloping down from the notch, till they leave a flat superficies. This they hollow out to a capacity to receive about a quart. They then put into the hollow a bit of lighted reed, and let it remain for about ten minutes, which acting as a stimulus, draws the fluid to that part. In the space of a night the liquor fills the receptacle prepared for it, and the tree continues to yield a lesser quantity for three successive nights, when the fire must be again applied: but on a few repetitions it is exhausted.
SUMATRA.

Benzoin. Benzoin or Benjamin (styraz benzoin) called by the Malays kamian, is, like the camphor, found almost exclusively in the Batta country, to the northward of the equator, but not in the Achinese dominions immediately beyond that district. It is also met with, though rarely, south of the line, but there, either from natural inferiority or want of skill in collecting it, the small quantity produced is black and of little value. The tree does not grow to any considerable size, and is of no value as timber. The seeds or nuts, which are round, of a brown colour, and about the size of a moderate bolus, are sown in the paddi-fields, and afterwards require no other cultivation than to clear away the shrubs from about the young plants. In some places, especially near the sea-coast, large plantations of it are formed, and it is said that the natives, sensible of the great advantage accruing to them from the trade, in a national point of view, oblige the proprietors, by legal regulation, to keep up the succession.

Mode of procuring it. When the trees have attained the age of about seven years, and are six or eight inches in diameter, incisions are made in the bark, from whence the balsam or gum (as it is commonly termed, although being soluble in spirits and not in water, it is rather a resin) exudes, which is carefully pared off. The purest of the gum, or Head benzoin, is that which comes from these incisions during the first three years, and is white, inclining to yellow, soft, and fragrant; after which it gradually changes to the second sort, which is of a reddish yellow, degenerating to brown; and at length when the tree, which will not bear a repetition of the process for more than ten or twelve years, is supposed to be worn out, they cut it down, and when split in pieces procure, by scraping, the worst sort, or Foot benzoin, which is dark coloured, hard, and mixed more or less with parings of the wood and other impurities. The Head is further distinguished into Europe and India-head, of which the first is superior, and is the only sort adapted to the home-market: the latter, with most of the inferior sorts, is exported to Arabia.

* See a Botanical Description of this tree by my friend Mr. Jonas Dryander, with a plate, in Vol. LXXVII. p. 307. of the Phil. Trans. for the year 1787.
Sumatra.

bía, Persia, and some parts of India, where it is burned, to perfume with its smoke their temples and private houses, expel troublesome insects, and obviate the pernicious effects of unwholesome air or noxious exhalations; in addition to which uses, in the Malayan countries, it is always considered as a necessary part of the apparatus in administering an oath. It is brought down from the country for sale in large cakes, called tampang, covered with mats; and these, as a staple commodity, are employed in their dealings for a standard of value, to which the price of other things have reference, as in most parts of the world to certain metals. In order to pack it in chests, it is necessary to soften the coarser sorts with boiling water; for the finer, it is sufficient to break the lumps and to expose it to the heat of the sun. The greater part of the quantity brought to England is re-exported from thence to countries where the Roman Catholic and Mahometan religions prevail, to be there burnt as incense in the churches and temples. The remainder is chiefly employed in medicine, being much esteemed as an expectorant and styptic, and constitutes the basis of that valuable balsam distinguished by the name of Turlington, whose very salutary effects, particularly in healing green and other wounds, is well known to persons abroad who cannot always obtain surgical assistance. It is also employed, if I am not misinformed, in the preparation of court sticking plaister. The gum or resin called dulang is named by us scented benzoin from its peculiar fragrance. The rasamala (lignum papuanum of Rumphius, and altingia excelsa of the Batavian Trans.) is a sort of wild benzoin, of little value, and not, in Sumatra, considered as an object of commerce.

Cassia

* Les Arabes tirent beaucoup d'autres sortes d'encens de l'Habbesch, de Sumatra, Siam, Java, &c. et parmi celles-là une qu'ils appellent Bachór (bakhór) Java, & que les Anglais nomment Benzoin, est très-similable à l'Olibán. On en exporte en grande quantité en Turquie par les golfs d'Arabie & de Perse, & la moindre des trois espèces de Benzoin, que les marchands vendent, est estimée meilleure que l'Olibán d'Arabie. Niebuhr, Description de l'Arabie, p. 126.

* According to Mr. Jackson the annual importation of Benzoin at Mogodor, from London, is about 13,000 lb. annually.
Cassia or *kulit manis* (laurus cassia) is a coarse species of cinnamon which flourishes chiefly, as well as the two foregoing articles, in the northern part of the island; but with this difference, that the camphor and benzoin grow only near the coast, whereas the cassia is a native of the central parts of the country. It is mostly procured in those districts which lie inland of Tapanuli, but it is also found in Musi, where Palembang River takes its rise. The leaves are about four inches long, narrower than the bay (to which tribe it belongs) and more pointed; deep green; smooth surface, and plain edge. The principal fibres take their rise from the peduncle. The young leaves are mostly of reddish hue. The blossoms grow six in number upon slender footstalks, close to the bottom of the leaf. They are monopetalous, small, white, stellated in six points. The stamina are six, with one stile, growing from the germen, which stands up in three brownish segments, resembling a cup. The trees grow from fifty to sixty feet high, with large, spreading, horizontal branches, almost as low as the earth. The root is said to contain much camphor, that may be obtained by boiling or other processes unknown on Sumatra. No pains is bestowed on the cultivation of the cassia. The bark, which is the part in use, is commonly taken from such of the trees as are a foot or eighteen inches diameter, for when they are younger, it is said to be so thin, as to lose all its qualities very soon. The difference of soil and situation alters considerably the value of the bark. Those trees which grow in a high, rocky soil, have red shoots, and the bark is superior to that which is produced in a moist clay, where the shoots are green. I have been assured by a person of extensive knowledge, that the cassia produced on Sumatra, is from the same tree which yields the true cinnamon, and that the apparent difference arises from the less judicious manner of quilling it. Perhaps the younger and more tender branches should be preferred; perhaps the age of the tree, or the season of the year, ought to be more nicely attended to; and lastly, I have known it to be suggested, that the mucilaginous slime which adheres to the inside of the fresh peeled rind, does, when not carefully wiped off, injure the flavour of the cassia, and render it inferior to that of the cinnamon. I am informed that it has been purchased by Dutch merchants at our India sales, where it sometimes sold to much loss, and afterwards by them shipped for
for Spain, as cinnamon, being packed in boxes which had come from Ceylon with that article. The price it bears in the island is about ten or twelve dollars the pecul.

Rattans, or *rotan* (calamus rotang) furnish annually many large cargoes, chiefly from the eastern side of the island, where the Dutch buy them to send to Europe; and the country traders for the western parts of India. Walking-canes, or *tongkat*, of various kinds, are also produced near the rivers which open to the straits of Malacca.

In almost every part of the country two species of cotton are cultivated, namely, the annual sort named *kapas* (gossypium herbaceum), and the shrub cotton named *kapas besar* (gossypium herboreum). The cotton produced from both appears to be of very good quality, and might, with encouragement, be procured in any quantities; but the natives raise no more than is necessary for their own domestic manufactures. The silk cotton or *kapok* (bombax) is also to be met with in every village. This is, to appearance, one of the most beautiful raw materials the hand of nature has presented. Its fineness, gloss, and delicate softness, render it, to the sight and touch, much superior to the labour of the silk-worm; but owing to the shortness and brittleness of the staple, it is esteemed unfit for the reel and loom, and is only applied to the unworthy purpose of stuffing pillows and mattresses. Possibly it has not undergone a fair trial in the hands of our ingenious artists, and we may yet see it converted into a valuable manufacture. It grows in pods, from four to six inches long, which burst open when ripe. The seeds entirely resemble the black pepper, but are without taste. The tree is remarkable, from the branches growing out perfectly straight and horizontal, and being always three, forming equal angles, at the same height: the diminutive shoots likewise grow flat; and the several gradations of branches observe the same regularity to the top. Some travellers have called it the umbrella tree, but the piece of furniture called a dumb waiter, exhibits a more striking picture of it.

The betel-nut or *pinang* (area catechu) before mentioned, is a considerable
The coffee trees are universally planted, but the fruit produced here is not excellent in quality, which is probably owing entirely to the want of skill in the management of them. The plants are disposed too close to each other, and are so much overshadowed by other trees, that the sun cannot penetrate to the fruit; owing to which the juices are not well ripened, and the berries, which become large, do not acquire a proper flavour. Add to this, that the berries are gathered whilst red, which is before they have arrived at a due degree of maturity, and which the Arabs always permit them to attain to, esteeming it essential to the goodness of the coffee. As the tree is of the same species with that cultivated in Arabia, there is little doubt, but with proper care, this article might be produced of a quality equal, perhaps superior, to that imported from the West Indies; though probably the heavy rains on Sumatra, may prevent its attaining to the perfection of the coffee of Mocha.

The dammar is a kind of turpentine or resin from a species of pine, and used for the same purposes to which that and pitch are applied. It is exported in large quantities to Bengal and elsewhere. It exudes, or flows
flows rather, spontaneously, from the tree in such plenty, that there is no need of making incisions to procure it. The natives gather it in lumps from the ground, where it has fallen, or collect it from the shores of bays and rivers, whither it has floated. It hangs from the bough of the tree which produces it, in large pieces, and hardening in the air it becomes brittle, and is blown off by the first high wind. When a quantity of it has fallen in the same place, it appears like a rock, and thence, they say, or more probably from its hardness, it is called dammar batu; by which name it is distinguished from the dammar kruyen. This is another species of turpentine, yielded by a tree growing in Lampong, called kruyen, the wood of which is white and porous. It differs from the common sort, or dammar batu, in being soft and whitish, having the consistence, and somewhat the appearance of putty. It is in much estimation for paying the bottoms of vessels, for which use, to give it firmness and duration, it ought to be mixed with some of the hard kind, of which it corrects the brittleness. The natives, in common, do not boil it, but rub or smear it on with their hands; a practice which is probably derived from indolence, unless, as I have been informed, that boiling it, without oil, renders it hard. To procure it, an incision is made in the tree.

Dragon’s blood, sanguis draconis, or jaranang, is a drug obtained from a large species of rattan, called rotan jaranang, growing abundantly in the countries of Palembang and Jambi, where it is manufactured and exported, in the first instance to Batavia, and from thence to China, where it is held in much estimation; but whether it be precisely the drug of our shops, so named, I cannot take upon me to determine. I am informed that it is prepared in the following manner: the stamina and others parts of fructification of this plant, covered with the farina, are mixed with a certain proportion of white dammar, and boiled in water until the whole is well incorporated, and the water evaporated; by which time the composition has acquired a red colour, and, when rubbed between the fingers, comes off in a dry powder. Whilst soft, it is usually poured into joints of small bamboo, and shipped in that state. According to this account, which I received from my friend Mr. Philip Braham, who had an opportunity of acquiring a knowledge of the process, the
resinous quality of the drug belongs only to the dammar, and not to the rotan.

Gambir. Gambir, or gatah gambir, is a juice extracted from the leaves of a plant of that name, inspissated by decoction, strained, suffered to cool and harden, and then cut into cakes of different shapes, or formed into balls. It is very generally eaten by the natives with their sirih or betel, and is supposed to have the property of cleansing and sweetening the mouth; for which reason it is also rubbed to the gums of infants. For a minute detail of the culture and manufacture of this article at Malacca, see the Batavian Trans. Vol. II. p. 356, where the plant is classed between the portlandia and roëlla of L. In other places it is obtained from a climbing or trailing plant, evidently the funis uncatus of Rumphius. See also "Observations on the Nauclea Gambir," by Mr. W. Hunter, in the Linnaean Trans. Vol. IX. p. 218. At Siak, Kampar, and Indragiri, on the eastern side of Sumatra, it is an important article of commerce.

Lignum aloes. The agallochin, agila-wood, or lignum aloes, called by the natives kalambak and kayu gaḥru, is highly prized in all parts of the East, for the fragrant scent it emits in burning. I find these two names used indiscriminately in Malayan writings, and sometimes coupled together; but Valentyn pronounces the gaḥru to be an inferior species, and the Batavian Catalogue describes it as the heart of the rasamala, and different from the genuine kalambak. This unctuous substance, which burns like a resin, is understood to be the decayed, and probably disordered, part of the tree. It is described by Kæmpfer (Amaenit, p. 903), under the Chinese name of sinkoo, and by Dr. Roxburgh under that of aquillaria agallocha.

Timber. The forests contain an inexhaustible store and endless variety of timber trees,

2 "Hoc unum adhuc addendum est, in Sumatra nempe ac forte in Java aliam quoque esse plantam repentem gata gambir akar dictam, que forte unae eademque erunt plantae; ac verbum akar Malaiensibus deotat non tantum radicem, sed repentem quoque fruticem." Vol. V. p. 64.
trees, many sorts of which are highly valuable, and capable of being applied to ship-building and other important purposes. On the western coast the general want of navigable rivers has materially hindered both the export and the employment of timber; but those on the eastern side, particularly Siak, have heretofore supplied the city of Batavia with great abundance, and latterly the naval arsenal at P°. Pinang with what is required for the construction of ships of war. The teak, however, the pride of Indian forests, called by the Malays jati (tectona grandis, L.), does not appear to be indigenous to this island, although flourishing to the northward and southward of it, in Pegu and Java; and I believe it is equally a stranger to the Malayan peninsula. Attempts have been made by the servants of the Company to promote its cultivation. Mr. Robert Hay had a plantation near Bencoolen, but the situation seemed unfavourable. Mr. John Marsden, when resident of Laye in the year 1776, sowed some seeds of it, and distributed a quantity amongst the inhabitants of his district. The former, at least, throve exceedingly, as if in their natural soil. The appearance of the tree is stately, the leaves are broad and large, and they yield, when squeezed, a red juice. The wood is well known to be, in many respects, preferable to oak, working more kindly, surpassing it in durability, and having the peculiar property of preserving the iron bolts driven into it from rust; a property that may be ascribed to the essential oil or tar contained in it, and which has lately been procured from it in large quantities by distillation at Bombay. Many ships built at that place have continued to swim so long, that none could recollect the period at which they were launched. For masts and yards the wood preferred is the red bintangur (a species of uvaria), which in all the maritime parts of India has obtained the name of poon or puhn, from the Malayan word signifying tree in general; as payu upas, the poison tree, puhn kayu, a timber tree, &c. The camphor wood, so useful for carpenters' purposes, has been already mentioned. Kayu pindis or kapini (species of metrosideros), is named also kayu besi, or iron-wood, on account of its extraordinary hardness, which turns the edge of common tools. Marbau (metrosideros amboinensis, R.) grows to a large size, and is used for beams both in ship and house-building, as well as for other purposes to which oak is applied in Europe. Pinaga is valuable as crooked timber, and used for frames and knees of ships,
SUMATRA.

ships, being also very durable. It frequently grows in the wash of the sea. Juar, ebony, called in the Batavian Catalogue kayu arang, or charcoal-wood, is found here in great plenty. Kayu gadis, a wood possessing the flavour and qualities of the sassafras, and used for the same purposes in medicine, but in the growth of the tree resembling rather our elm than the laurus (to which latter tribe the American sassafras belongs), is very common in the plains near Bencoolen. Kayu arau (casuarina littorea) is often termed a bastard pine, and as such gave name to the Isle of Pines discovered by Capt. Cook. By the Malays it is usually called kayu chamara, from the resemblance of its branches to the ornamental cow-tails of Upper India. It has been already remarked of this tree, whose wood is not particularly useful, that it delights in a low sandy soil, and is ever the first that springs up from land relinquished by the sea. The rañgas or rañgi, commonly supposed to be the manchineel of the West Indies, but perhaps only from the noxious quality of its juices, is the arbor vernicos of Rumphius, and particularly described in the Batav. Trans. Vol. V. under the name of Manga deleteria sylvestris, fructu parvo cordiformi. In a list of plants in the same volume, by F. Norona, it is termed anacardium encardium. The wood has some resemblance to mahogany, is worked up into articles of furniture, and resists the destructive ravages of the white ant, but its hardness and acrid sap, which blisters the hands of those employed about it, are objections to its general use. I am not aware of the natives procuring a varnish from this tree. Of the various sorts of tree producing dammar, some are said to be valuable as timber, particularly the species called dammar laut, not mentioned by Rumphius, which is employed at Pò. Pinang for frame timbers of ships, beams, and knees. Kamuning (camunium, R. chalcas paniculata, Lour.) is a light coloured wood, close, and finely grained, takes an exquisite polish, and is used for the sheaths of krises. There is also a red grained sort, in less estimation. The appearance of the tree is very beautiful, resembling in its leaves the larger myrtle, with a white flower. The lanígsani likewise is a wood handsomely veined, and is employed for cabinet and carved work. Beside these the kinds of wood most in use are the madang, ballam, maranti, laban, and marakuli. The variety is much greater, but many, from their porous nature and proneness to decay, are of very little value, and scarcely admit of seasoning before they become rotten. I cannot
I cannot quit the vegetable kingdom without noticing a tree, which although of no use in manufacture or commerce, not peculiar to the island, and has been often described, merits yet, for its extreme singularity, that it should not be passed over in silence. This is the jawi-jawi and ulang-ulang of the Malays, the banian tree of the continent, the grossularia domestica of Rumphius, and the ficus indica or ficus racemosa of Linnaeus. It possesses the uncommon property of dropping roots or fibres from certain parts of its boughs, which, when they touch the earth, become new stems, and go on increasing to such an extent, that some have measured, in circumference of the branches, upwards of a thousand feet, and have been said to afford shelter to a troop of horse. These fibres, that look like ropes attached to the branches, when they meet with any obstruction in their descent, conform themselves to the shape of the resisting body, and thus occasion many curious metamorphoses. I recollect seeing them stand in the perfect shape of a gate, long after the original posts and cross piece had decayed and disappeared; and I have been told of their lining the internal circumference of a large bricked well, like the worm in a distiller's tub; there exhibiting the view of a tree turned inside out, the branches pointing to the centre, instead of growing from it. It is not more extraordinary in its manner of growth, than whimsical and fantastic in its choice of situations. From the side of a wall, or the top of a house, it seems to spring spontaneously. Even from the smooth surface of a wooden pillar, turned and painted, I have seen it shoot forth, as if the vegetative juices of the seasoned timber had renewed their circulation, and begun to produce leaves afresh. I have seen it flourish in the centre of a hollow tree, of a very different species, which, however, still retained its verdure, its branches encompassing those of the adventitious plant, whilst its decayed trunk enclosed the stem, which was visible, at interstices, from nearly the level of the plain

The following is an account of the dimensions of a remarkable banian or burr tree, near Manjee, twenty miles west of Patna in Bengal. Diameter 363 to 375 feet. Circumference of shadow at noon, 1116 feet. Circumference of the several stems, in number fifty or sixty, 921 feet. Under this tree sat a naked Fakir, who had occupied that situation for twenty-five years; but he did not continue there the whole year through, for his vow obliged him to lie, during the four cold months, up to his neck in the waters of the river Ganges.
plain on which they grew. This, in truth, appeared so striking a curiosity, that I have often repaired to the spot, to contemplate the singularity of it. How the seed, from which it is produced, happens to occupy stations seemingly so unnatural, is not easily determined. Some have imagined the berries carried thither by the wind, and others, with more appearance of truth, by the birds; which, cleansing their bills where they light, or attempt to light, leave, in those places, the seeds, adhering by the viscous matter which surrounds them. However this be, the jawi-jawi, growing on buildings without earth or water, and deriving from the genial atmosphere its principle of nourishment, proves in its increasing growth highly destructive to the fabric where it is harboured; for the fibrous roots, which are at first extremely fine, penetrate common cements, and overcoming, as their size enlarges, the most powerful resistance, split, with the force of the mechanic wedge, the most substantial brickwork. When the consistence is such as not to admit the insinuation of the fibres, the root extends itself along the outside, and to an extraordinary length, bearing, not unfrequently, to the stem, the proportion of eight to one, when young. I have measured the former sixty inches, when the latter, to the extremity of the leaf, which took up a third part, was no more than eight inches. I have also seen it wave its boughs at the apparent height of two hundred feet, of which the roots, if we may term them such, occupied at least one hundred; forming, by their close combination, the appearance of a venerable gothic pillar. It stood near the plains of Krakap, but, like other monuments of antiquity, it had its period of existence, and is now no more.
Gold, Tin, and other Metals.—Bees-wax.—Ivory.—Bird's-nest, &c.

Import-Trade.

Beside those articles of trade afforded by the vegetable kingdom, gold. Sumatra produces many others, the chief of which is gold. This valuable metal is found mostly in the central parts of the island; none (or with few exceptions) being observed to the southward of Limun, a branch of Jambi River, nor to the northward of Nalabu, from which port Achin is principally supplied. Menangkabau has always been esteemed the richest seat of it; and this consideration probably induced the Dutch to establish their head factory at Padang, in the immediate neighbourhood of that kingdom. Colonies of Malays from thence have settled themselves in almost all the districts where gold is procured, and appear to be the only persons who dig for it in mines, or collect it in streams; the proper inhabitants or villagers confining their attention to the raising of provisions, with which they supply those who search for the metal. Such at least appears to be the case in Limun, Batang Asei, and Pakalang jambu, where a considerable gold-trade is carried on.

It has been generally understood at the English settlements that earth taken up from the beds of rivers, or loosened from the adjacent banks, and washed by means of rivulets diverted towards the newly-opened ground, furnishes the greater proportion of the gold found in the island, and that the natives are not accustomed to venture upon any excavation that deserves the name of mining; but our possession, during the present war, of the settlements that belonged to the Dutch, has enabled us to form juster notions on the subject, and the following account, obtained from well-informed persons on the spot, will shew the methods pursued in both processes, and the degree of enterprise and skill employed by the workmen.

In the districts situated inland of Padang, which is the principal mart
for this article, little is collected otherwise than from mines (tambang) by people whose profession it is to work them, and who are known by the appellation of orang gulla. The metal brought down for sale is for the most part of two sorts, distinguished by the terms amas supayang and amas suŋgei-abu, from the names of places where they are respectively procured. The former is what we usually call rock-gold, consisting of pieces of quartz more or less intermixed with veins of gold, generally of fine quality, running through it in all directions, and forming beautiful masses, which, being admired by Europeans, are sometimes sold by weight as if the whole were solid metal. The mines yielding this sort are commonly situated at the foot of a mountain, and the shafts are driven horizontally, to the extent of from eight to twenty fathoms. The gold to which suŋgei-abu gives name is, on the contrary, found in the state of smooth, solid lumps, in shape like gravel, and of various sizes, the largest lump that I have seen, weighing nine ounces, fifteen grains, and one in my possession (for which I am indebted to Mr. Charles Holloway) weighing eight grains less than nine ounces. This sort is also termed amas lichin or smooth gold, and appears to owe that quality to its having been exposed, in some prior state of the soil or conformation of the earth, to the action of running water, and deprived of its sharp and rough edges by attrition. This form of gravel is the most common in which gold is discovered. Gold-dust or amas urei is collected either in the channels of brooks running over ground rich in the metal, in standing pools of water occasioned by heavy rains, or in a number of holes dug in a situation to which a small rapid stream can be directed.

The tools employed in working the mines are an iron crow three feet in length, called tabah, a shovel called chaŋkul, and a heavy iron mallet or hammer, the head of which is eighteen inches in length and as thick as a man's leg, with a handle in the middle. With this they beat the lumps of rock till they are reduced to powder, and the pounded mass is then put into a sledge or tray, five or six feet long and one and an half broad, in the form of a boat, and thence named bidu. To this vessel a rope of īju is attached, by which they draw it, when loaded, out of the horizontal mine, to the nearest place where they can meet
SUMATRA.

with a supply of water, which alone is employed to separate the gold from the pulverized quartz.

In the perpendicular mines the smooth or gravel-gold is often found near the surface, but in small quantities, improving as the workmen advance, and again often vanishing suddenly. This they say is most likely to be the case, when, after pursuing a poor vein they suddenly come to large lumps. When they have dug to the depth of four, six, or sometimes eight fathoms, (which they do at a venture, the surface not affording any indications on which they can depend) they work horizontally, supporting the shaft with timbers; but to persons acquainted with the berg-werken of Germany or Hungary, these pits would hardly appear to merit the appellation of mines. In Siberia, however, as in Sumatra, the hills yield their gold by slightly working them. Sand is commonly met with at the depth of three or four fathoms, and beneath this a stratum of napal or steatite, which is considered as a sign that the metal is near; but the least fallible mark is a red stone, called batu kawi, lying in detached pieces. It is mostly found in red and white clay, and often adhering to small stones, as well as in homogeneous lumps. The gold is separated from the clay by means of water poured on a hollow board, in the management of which the persons employed are remarkably expert.

In these perpendicular mines the water is drawn off by hand in pails or buckets. In the horizontal, they make two shafts or entries in a direction parallel to each other, as far as they mean to extend the work, and there connect them by a cross trench. One of these, by a difference in their respective levels, serves as a drain to carry off the water, whilst the other is kept dry. They work in parties of from four or five, to forty or fifty in number; the proprietor of the ground receiving one half of the produce, and the undertakers the other; and it does not appear that the prince receives any established royalty. The hill people affect a kind

* It has been observed to me, that it is not so much the want of windlasses or machines (substitutes for which they are ready enough at contriving), that prevents excavation to a great depth, as the apprehension of earthquakes, the effect of which has frequently been to overwhelm them before they could escape even from their shallow mines.
kind of independence or equality, which they express by the term of sama rata.

It may well be imagined that mines of this description are very numerous, and in the common estimation of the natives they amount to no fewer than twelve hundred in the dominions of Menangkabau. A considerable proportion of their produce (perhaps one half) never comes into the hands of Europeans, but is conveyed to the eastern side of the island, and yet I have been assured on good authority, that from ten to twelve thousand ounces have annually been received, on public and private account, at Padang alone; at Nalabu about two thousand, Natal eight hundred, and Moco-moco six hundred. The quality of the gold collected in the Padang districts is inferior to that purchased at Natal and Moco-moco, in consequence of the practice of blending together the unequal produce of such a variety of mines, which in other parts it is customary to keep distinct. The gold from the former is of the fineness of from nineteen to twenty-one, and from the latter places is generally of from twenty-two to twenty-three carats. The finest that has passed through my hands was twenty-three carats, one grain and an half; assayed at the Tower of London. Gold of an inferior touch, called amas muda from the paleness of its colour, is found in the same countries where the other is produced. I had some assayed which was two carats three grains worse than standard, and contained an alloy of silver; but not in a proportion to be affected by the acids. I have seen gold brought from Mampawah in Borneo, which was in the state of a fine, uniform powder, high coloured, and its degree of fineness not exceeding fifteen or sixteen carats. The natives suppose these differences to proceed from an original essential inferiority of the metal, not possessing the art of separating it from the silver or copper. In this island it is never found in the state of ore, but is always completely metallic. A very little pale gold is now and then found in the Lampung country.

Of those who dig for it, the most intelligent, distinguished by the name of sudagar or merchants, are intrusted by the rest with their collections, who carry the gold to the places of trade on the great eastern rivers, or to the settlements on the west coast, where they barter it for iron (of which
which large quantities are consumed in tools for working the mines), opium, and the fine piece-goods of Madras and Bengal, with which they return, heavily loaded to their country. In some parts of the journey they have the convenience of water carriage, on lakes and rivers; but in others they carry on their backs a weight of about eighty pounds, through woods, over streams, and across mountains; in parties generally of one hundred or more, who have frequent occasion to defend their property against the spirit of plunder and extortion which prevails among the poorer nations, through whose districts they are obliged to pass. Upon the proposal of striking out any new road, the question always asked by these intermediate people is, "apa ontong kami, what is to be our advantage?"

When brought to our settlements it was formerly purchased at the rate of eighteen Spanish dollars the ātāl, or about three pounds five shillings the ounce, but in later times it has risen to twenty-one dollars, or to three pounds eighteen shillings the ounce. Upon exportation to Europe, therefore, it scarcely affords a profit to the original buyer, and others who employ it as a remittance, incur a loss, when insurance and other incidental charges are deducted. A duty of five per cent which it had been customary to charge at the East India-house, was, about twenty years ago, most liberally remitted by the Company, upon a representation made by me to the Directors of the hardship sustained in this respect by its servants at Fort Marlborough, and the public benefit that would accrue from giving encouragement to the importation of bullion. The long continuance of war, and peculiar risk of Indian navigation resulting from it, may probably have operated to counteract these good effects.

It has generally been thought surprising that the European Companies who have so long had establishments in Sumatra, should not have considered it an object to work these mines upon a regular system, with proper machinery, and under competent inspection; but the attempt has in fact been made, and experience and calculation may have taught them that it is not a scheme likely to be attended with success, owing among other causes, to the dearness of labour, and the necessity it
would occasion for keeping up a force in distant parts of the country, for the protection of the persons engaged and the property collected. Europeans cannot be employed upon such work in that climate, and the natives are unfit for (nor would they submit to) the laborious exertion required to render the undertaking profitable. A detailed, and in many respects interesting account of the working a gold mine at Sileda, with a plate representing a section of the mine, is given by Elias Hesse, who, in the year 1682, accompanied the Bergh-Hoofdman, Benj. Olitzsch, and a party of miners from Saxony, sent out by the Dutch East-India Company for that purpose. The superintendant, with most of his people, lost their lives, and the undertaking failed. It is said at Padang that the metal proved to be uncommonly poor. Many years later, trial was made of a vein running close to that settlement; but the returns not being adequate to the expense, it was let to farm, and in a few years fell into such low repute as to be at length disposed of by public auction, at a rent of two Spanish dollars. The English company also having intelligence of a mine said to be discovered near Fort Marlborough, gave orders for its being worked; but if it ever existed, no trace now remains.

Before the gold dust is weighed for sale, in order to cleanse it from all impurities

---

a Ost-Indische Reise-beschreibung oder Diarium. Leipzig, 1690, 8vo. See also J. W. Vogel's Ost-Indianische Reise-beschreibung. Altenburg, 1704, 8vo.

b The following is an extract of a letter from Mr. James Moore, a servant of the Company, dated from Padang, in 1778. 'They have lately opened a vein of gold in the country inland of this place, from which the governor at one time received an hundred and fifty tals (two hundred ounces). He has procured a map to be made of a particular part of the gold country, which points out the different places where they work for it; and also the situation of twenty-one Malay forts, all inhabited and in repair. These districts are extremely populous, compared to the more southern part of the island. They collect and export annually to Batavia, about two thousand five hundred tals of gold from this place: the quantity never exceeds three thousand tals, nor falls short of two thousand.' This refers to the public export on the Company's account, which agrees with what is stated in the Batav. Traus. 'In een goed Jaar geven de Tigablas cottas omtrent 3000 Thail, zynde 6 Thail een Mark, dus omtrent 500 Mark Goud, van 't gehalte van 19. tot 20. carat.'
impurities and heterogeneous mixtures, whether natural or fraudulent, (such as filings of copper or of iron) a skilful person is employed, who, by the sharpness of his eye, and long practice, is able to effect this to a surprising degree of nicety. The dust is spread out on a kind of wooden platter, and the base particles (lanchong) are touched out from the mass and put aside one by one, with an instrument, if such it may be termed, made of cotton cloth rolled up to a point. If the honesty of these gold-cleaners can be depended upon, their dexterity is almost infallible; and as some check upon the former, it is usual to pour the contents of each parcel when thus cleansed, into a vessel of aqua-fortis, which puts their accuracy to the test. The parcels or bulses in which the gold is packed up, are formed of the integument that covers the heart of the buffalo. This has the appearance of bladder, but is both tougher and more pliable. In those parts of the country where the traffic in the article is considerable, it is generally employed as currency instead of coin; every man carries small scales about him, and purchases are made with it so low as to the weight of a grain or two of padi. Various seeds are used as gold weights, but more especially these two: the one called rakat or sasa-timbañgan (glycine abrus L. or abrus maculatus of the Batav. Trans.) being the well-known scarlet pea with a black spot; twenty-four of which constitute a mas, and sixteen mas a tāil: the other called saga-puhn and kondori batang (adenanthera pavonia, L.), a scarlet or rather coral bean, much larger than the former, and without the black spot. It is the candarin-weight of the Chinese, of which an hundred make a tāil, and equal, according to the tables published by Stevens, to 5,7984 gr. troy; but the average weight of those in my possession is 10,50 grains. The tāil differs however in the northern and southern parts of the island, being at Natal twenty-four penny-weights, nine grains, and at Padang, Bencoolen, and elsewhere, twenty-six penny weights, twelve grains. At Achin the bangkal of thirty penny-weights, twenty-one grains, is the standard. Spanish dollars are every where current, and accounts are kept in dollars, sukus (imaginary quarter dollars) and kepping or copper cash, of which four hundred go to the dollar. Beside these, there are silver fanams, single, double, and treble (the latter called tali) coined at Madras; twenty-four fanams or eight talis being equal to the Spanish dollar, which is always valued in the English settlements at five

shillings
shillings sterling. Silver rupihs have occasionally been struck in Bengal, for the use of the settlements on the coast of Sumatra, but not in sufficient quantities to become a general currency; and in the year 1786, the Company contracted with the late Mr. Boulton of Soho, for a copper coinage, the proportions of which I was desired to adjust, as well as to furnish the inscriptions; and the same system, with many improvements suggested by Mr. Charles Wilkins, has since been extended to the three Presidencies of India. At Achin, small, thin gold and silver coins were formerly struck and still are current; but I have not seen any of the pieces that bore the appearance of modern coinage; nor am I aware that this right of sovereignty is exercised by any other power in the island.

Tin, called timar, is a very considerable article of trade, and many cargoes of it are yearly carried to China, where the consumption is chiefly for religious purposes. The mines are situated in the island of Bangka, lying near Palembang, and are said to have been accidentally discovered there in 1710, by the burning of a house. They are worked by a colony of Chinese (said in the Batav. Trans. to consist of twenty-five thousand persons) under the nominal direction of the king of Palembang, but for the account and benefit of the Dutch Company, which has endeavoured to monopolize the trade, and actually obtained two millions of pounds yearly; but the enterprising spirit of private merchants, chiefly English and American, finds means to elude the vigilance of its cruisers, and the commerce is largely participated by them. It is exported for the most part in small pieces or cakes called tampang, and sometimes in slabs. M. Sonnerat reports that this tin (named calin by the French writers), was analysed by M. Daubenton, who found it to be the same metal as that produced in England; but it sells something higher than our grain-tin. In different parts of Sumatra, there are indications of tin-earth, or rather sand, and it is worked at the mountain of Sinigei-pagu, but not to any great extent. Of this sand, at Bangka, a pikul, or 133lb. is said to yield about 75lb. of the metal.

Copper. A rich mine of copper is worked at Mukki near Labuan-haji, by the Achinese. The ore produces half its original weight in pure metal, and
is sold at the rate of twenty dollars the pikul. A lump which I deposited in the Museum of the East-India Company, is pronounced to be native copper. The Malays are fond of mixing this metal with gold, in equal quantities, and using the composition, which they name *swasa*, in the manufacture of buttons, betel boxes, and heads of krises. I have never heard silver spoken of as a production of this part of the East. Iron ore is dug at a place named *Turawang*, in the eastern part of *Menangkabau*, and there smelted, but not, I apprehend, in large quantities, the consumption of the natives being amply supplied with English and Swedish bar-iron, which they are in the practice of purchasing by measure instead of weight.

Sulphur (*balêrang*) as has been mentioned, is abundantly procured from the numerous volcanos, and especially from that very great one which is situated about a day’s journey inland from *Priaman*. Yellow Arsenic (*bârâñgan*) is also an article of traffic.

In the country of *Kattaun*, near the head of *Urei* river, there are extensive caves (*goha*) from the soil of which saltpetre (*mesiyu mantah*) is extracted. M. Whalfeldt, who was employed as a surveyor, visited them in March 1773. Into one he advanced seven hundred and forty-three feet, when his lights were extinguished by the damp vapour. Into a second he penetrated six hundred feet, when after getting through a confined passage, about three feet wide and five in height, an opening in the rock led to a spacious place forty feet high. The same caves were visited by Mr. Christopher Terry and Mr. Charles Miller. They are the habitation of innumerable birds, which are perceived to abound the more, the farther you proceed. Their nests are formed about the upper parts of the cave, and it is thought to be their dung simply that forms the soil (in many places from four to six feet deep, and from fifteen to twenty broad) which affords the nitre. A cubic foot of this earth, measuring seven gallons, produced on boiling seven pounds, fourteen ounces of saltpetre, and a second experiment gave a ninth part more. This I afterwards saw refined to a high degree of purity; but I conceive that its value would not repay the expense of the process.
The edible birds-nest, so much celebrated as a peculiar luxury of the table, especially amongst the Chinese, is found in similar caves in different parts of the island, but chiefly near the sea-coast, and in the greatest abundance at its southern extremity. Four miles up the river Kroë there is one of considerable size. The birds are called layang-layang, and resemble the common swallow, or, perhaps, rather the martin. I had an opportunity of giving to the British Museum some of these nests with the eggs in them. They are distinguished into white and black, of which the first are by far the more scarce and valuable, being found in the proportion of one only to twenty-five. The white sort sells in China at the rate of a thousand to fifteen hundred dollars the pikul, (according to the Batav. Trans. for nearly its weight in silver) the black is usually disposed of at Batavia at about twenty or thirty dollars for the same weight, where I understand it is chiefly converted into a kind of glue. The difference between the two sorts has by some been supposed to be owing to the mixture of the feathers of the birds with the viscous substance of which the nests are formed; and this they deduce from the experiment of steeping the black nests for a short time in hot water, when they are said to become white to a certain degree. Among the natives I have heard a few assert, that they are the work of a different species of bird. It was also suggested to me, that the white might probably be the recent nests of the season in which they were taken, and the black, such as had been used for several years successively. This opinion appearing plausible, I was particular in my inquiries as to that point, and learned what seems much to corroborate it. When the natives prepare to take the nests, they enter the cave with torches, and forming ladders of bamboos notched, according to the usual mode, they ascend and pull down the nests, which adhere in numbers together, from the sides and top of the rock. I was informed, that the more regularly the cave is thus stript, the greater proportion of white nests they are sure to find, and that on this experience they often make a practice of beating down and destroying the old nests in larger quantities than they trouble themselves to carry away, in order that they may find white nests the next season in their room. The birds, I am assured, are seen, during the building time, in large flocks upon the beach, collecting in their beaks the
the foam thrown up by the surf, of which there appears little doubt of their constructing their gelatinous nests, after it has undergone, perhaps, some preparation from commixture with their saliva or other secretion in the beak or the craw; and that this is the received opinion of the natives appears from the bird being very commonly named layang-buhi, the foam-swallow. Linnaeus, however, has conjectured, and with much plausibility, that it is the animal substance frequently found on the beach, which fishermen call blubber or jellies, and not the foam of the sea, that these birds collect; and it is proper to mention, that in a Description of these Nests by M. Hooyman, printed in Vol. III. of the Batav. Trans. he is decidedly of opinion, that the substance of them has nothing to do with the sea-foam, but is elaborated from the food of the bird. Mr. John Crisp informed me that he had seen at Padang a common swallow's nest, built under the eaves of a house, which was composed partly of common mud, and partly of the substance that constitutes the edible nests. The young birds themselves are said to be very delicate food, and not inferior in richness of flavour to the beccafico.

The swala, tripan, or sea-slug (holothurion), is likewise an article of trade to Batavia and China, being employed, as birds-nest or vermicelli, for enriching soups and stews, by a luxurious people. It sells at the former place for forty-five dollars per pikul, according to the degree of whiteness and other qualities.

Bees wax is a commodity of great importance in all the eastern islands, from whence it is exported, in large oblong cakes, to China, Bengal, and other parts of the continent. No pains are taken with the bees, which are left to settle where they list (generally on the boughs of trees) and are never collected in hives. Their honey is much inferior to that of Europe, as might be expected from the nature of the vegetation.

Gum-lac, called by the natives ampalu or ambalu, although found upon trees, and adhering strongly to the branches, is known to be the work of insects, as wax is of the bee. It is procured in small quantities from the country inland of Bencoolen; but at Padang is a considerable article of trade. Foreign markets, however, are supplied from the countries of Siam
Siam and Camboja. It is chiefly valued in Sumatra for the animal part, found in the nidus of the insect, which is soluble in water, and yields a very fine purple dye, used for colouring their silks and other webs of domestic manufacture. Like the cochineal it would probably, with the addition of a solution of tin, become a good scarlet. I find in a Bisayan dictionary, that this substance is employed by the people of the Philippine Islands, for staining their teeth red. For an account of the lac insect, see in the Phil. Trans. Vol. LXXI. p. 374. a paper by Mr. James Kerr.

Ivory. The forests abounding with elephants, ivory (gading) is consequently found in abundance, and is carried both to the China and Europe markets. The animals themselves were formerly the objects of a considerable traffic from Achin to the coast of Coromandel, or kling country, and vessels were built expressly for their transport; but it has declined, or perhaps ceased altogether, from the change which the system of warfare has undergone, since the European tactics have been imitated by the princes of India.

Fish-roe. The large roes of a species of fish (said to be like the shad, but more probably of the mullet-kind) taken in great quantities at the mouth of Siak River, are salted and exported from thence to all the Malayan countries, where they are eaten with boiled rice, and esteemed a delicacy. This is the botarga of the Italians, and here called trobo and telur-trobo.

Import-trade. The most general articles of import-trade are the following. From the coast of Coromandel various cotton goods, as long-cloth, blue and white, chintz, and coloured handkerchiefs, of which those manufactured at Pulicat are the most prized; and salt: from Bengal, muslins, striped and plain, and several other kinds of cotton goods, as cossaes, baftaes, hummums, &c. taffetas and some other silks; and opium in considerable quantities: from the Malabar coast, various cotton goods, mostly of a coarse, raw fabric: from China, coarse porcelain, kwalis or iron pans, in sets of various sizes, tobacco shred very fine, gold thread, fans, and a number of small articles: from Celebes (known here by
by the names of its chief provinces, Manükasar, Bugis, and Mandar), Java, Balli, Ceram, and other eastern islands, the rough, striped cotton cloth, called kāin sarong, or vulgarly bugis-clouting, being the universal body-dress of the natives; krises and other weapons, silken kris-belts, tudongs or hats, small pieces of ordnance, commonly of brass, called rantaka, spices, and also salt of a large grain, and sometimes rice, chiefly from Balli; from Europe, silver, iron, steel, lead, cutlery, various sorts of hardware, brass wire, and broad cloths, especially scarlet. It is not within my plan to enlarge on this subject, by entering into a detail of the markets for, or prices of, the several articles, which are extremely fluctuating, according to the more or less abundant or scanty supply. Most of the kinds of goods above enumerated are incidentally mentioned in other parts of the work, as they happen to be connected with the account of the natives who purchase them.
Arts and Manufactures.—Art of Medicine.—Sciences.—Arithmetic.—
Geography.—Astronomy.—Music, &c.

**Arts and Manufactures.** I SHALL now take a view of those arts and manufactures which the Sumatrans are skilled in, and which are not merely domestic, but contribute rather to the conveniences, and in some instances to the luxuries, than to the necessaries of life. I must remind the reader that my observations on this subject are mostly drawn from the Rejangs, or those people of the island who are upon their level of improvement. We meet with accounts in old writers, of great founderies of cannon in the dominion of Achin, and it is certain that fire-arms, as well as krises, are at this day manufactured in the country of Menangkabau; but my present description does not go to these superior exertions of art, which certainly do not appear among those people of the island whose manners, more immediately, I am attempting to delineate. What follows, however, would seem an exception to this limitation; there being no manufacture in that part of the world, and perhaps I might be justified in saying, in any part of the world, that has been more admired and celebrated, than the fine gold and silver filagree of Sumatra. This, indeed, is, strictly speaking, the work of the Malayan inhabitants; but as it is in universal use and wear throughout the country, and as the goldsmiths are settled everywhere along the coast, I cannot be guilty of much irregularity in describing here the process of their art.

**Filagree.** There is no circumstance that renders the filagree a matter of greater curiosity, that the coarseness of the tools employed in the workmanship, and which, in the hands of an European, would not be thought sufficiently perfect for the most ordinary purposes. They are rudely and inartificially formed, by the goldsmith (pandei), from any old iron he can procure. When you engage one of them to execute a piece of work, his
his first request is usually for a piece of iron hoop, to make his wire-
drawing instrument; an old hammer head, stuck in a block, serves for
an anvil; and I have seen a pair of compasses composed of two old
nails tied together at one end. The gold is melted in a piece of a priuk
or earthen rice pot, or sometimes in a crucible of their own making, of
common clay. In general they use no bellows, but blow the fire with
their mouths, through a joint of bamboo, and if the quantity of metal
to be melted is considerable, three or four persons sit round their furnace,
which is an old broken kwali or iron pot, and blow together. At Pad-
dang alone, where the manufacture is more considerable, they have
adopted the Chinese bellows. Their method of drawing the wire dif-
fers but little from that used by European workmen. When drawn to
a sufficient fineness, they flatten it, by beating it on their anvil; and
when flattened, they give it a twist, like that in the whalebone handle of
a punch-ladle, by rubbing it on a block of wood, with a flat stick. Af-
fter twisting, they again beat it on the anvil, and by these means it be-
comes flat wire with indented edges. With a pair of nippers they fold
down the end of the wire, and thus form a leaf, or element of a flower
in their work, which is cut off. The end is again folded and cut off,
till they have got a sufficient number of leaves, which are all laid on
singly. Patterns of the flowers or foliage, in which there is not very
much variety, are prepared on paper, of the size of the gold plate on
which the filagree is to be laid. According to this, they begin to dis-
pose on the plate the larger compartments of the foliage, for which they
use plain flat wire of a larger size, and fill them up with the leaves before
mentioned. To fix their work they employ a glutinous substance, made of
the small red pea with a black spot before mentioned, ground to a pulp, on
a rough stone. This pulp they place on a young coconut, about the size
of a walnut, the top and bottom being cut off. I at first imagined that cap-
price alone might have directed them to the use of the coconut for this
purpose; but I have since reflected on the probability of the juice of
the young fruit being necessary to keep the pulp moist, which would
otherwise speedily become dry and unfit for the work. After the
leaves have been all placed in order, and stuck on, bit by bit, a solder
is prepared of gold filings and borax, moistened with water, which they
strew or daub over the plate with a feather, and then putting it in the
fire
fire for a short time, the whole becomes united. This kind of work on a gold plate, they call *karrang papan*: when the work is open, they call it *karrang trūs*. In executing the latter, the foliage is laid out on a card, or soft kind of wood covered with paper, and stuck on, as before described, with the paste of the red seed; and the work, when finished, being strewed over with their solder, is put into the fire, when the card or soft wood burning away, the gold remains connected. The greatest skill and attention is required in this operation, as the work is often made to run by remaining too long, or in too hot a fire. If the piece be large, they solder it at several times. When the work is finished, they give it that fine, high colour they so much admire, by an operation which they term *sapoh*. This consists in mixing nitre, common salt, and alum, reduced to powder and moistened, laying the composition on the filagree, and keeping it over a moderate fire until it dissolves and becomes yellow. In this situation the piece is kept for a longer or shorter time, according to the intensity of colour they wish the gold to receive. It is then thrown into water, and cleansed. In the manufacture of *baju* buttons, they first make the lower part flat, and having a mould formed of a piece of buffalo’s horn, indented to several sizes, each like one half of a bullet mould, they lay their work over one of these holes, and with a horn punch they press it into the form of the button. After this they complete the upper part. The manner of making the little balls, with which their works are sometimes ornamented, is as follows. They take a piece of charcoal, and having cut it flat and smooth, they make in it a small hole, which they fill with gold dust, and this melted in the fire becomes a little ball. They are very inexpert at finishing and polishing the plain parts, hinges, screws, and the like, being in this as much excelled by the European artists, as these fall short of them in the fineness and minuteness of the foliage. The Chinese also make filagree, mostly of silver, which looks elegant, but wants likewise the extraordinary delicacy of the Malayan work. The price of the workmanship depends upon the difficulty or novelty of the pattern. In some articles of usual demand, it does not exceed one-third of the value of the gold; but, in matters of fancy, it is generally equal to it. The manufacture is not now (1780) held in very high estimation in England, where costliness is not so much the object of luxury, as variety; but, in the revolution
revolution of taste, it may probably be again sought after, and admired as fashionable.

But little skill is shewn amongst the country people in forging iron. They make nails, however, though not much used by them in building, wooden pins being generally substituted; also various kinds of tools, as the prang or bill, the banchi, rembé, billiong, and papatil, which are different species of adzes, the kapak or axe, and the pango kur or hoe. Their fire is made with charcoal; the fossil coal which the country produces being rarely, if ever, employed, except by the Europeans; and not by them of late years, on the complaint of its burning away too quickly: yet the report made of it in 1719 was, that it gave a surer heat than the coal from England. The bed of it (described rather as a large rock above ground) lies four days’ journey up Bencoolen River, from whence quantities are washed down by the floods. The quality of coal is rarely good near the surface. Their bellows are thus constructed: two bamboos, of about four inches diameter and five feet in length, stand perpendicularly near the fire; open at the upper end, and stopt below. About an inch or two from the bottom a small joint of bamboo is inserted into each, which serve as nozles, pointing to, and meeting at, the fire. To produce a stream of air, bunches of feathers, or other soft substance, being fastened to long handles, are worked up and down in the upright tubes, like the piston of a pump. These, when pushed downwards, force the air through the small horizontal tubes; and by raising and sinking each alternately, a continual current or blast is kept up; for which purpose a boy is usually placed on a high seat or stand. I cannot refrain from remarking, that the description of the bellows used in Madagascar, as given by Sonnerat, Vol. II. p. 60, so entirely corresponds with this, that the one might almost pass for a copy of the other.

The progress they have made in carpenter’s work has been already pointed out, where there buildings were described. They are ignorant of the use of the saw, excepting where we have introduced it among them. Trees are felled by chopping at the stems, and in procuring boards, they are confined to those, the direction of whose grain, or other
other qualities, admit of their being easily split asunder. In this respect the species called maranti and marakuli have the preference. The tree, being stripped of its branches and its bark, is cut to the length required, and by the help of wedges split into boards. These being of irregular thickness, are usually dubbed upon the spot. The tool used for this purpose is the rembé, a kind of adze. Most of their smaller work, and particularly on the bamboo, is performed with the papatil, which resembles in shape, as much as in name, the patupatu of the New-Zealanders, but has the vast superiority of being made of iron. The blade, which is fastened to the handle with a nice and curious kind of rattan-work, is so contrived as to turn in it, and by that means can be employed either as an adze or small hatchet. Their houses are generally built with the assistance of this simple instrument alone. The billing is no other than a large papatil, with a handle of two or three feet in length, turning, like that, in its socket.

The chief cement they employ, for small work, is the curd of buffalomilk, called prakat. It is to be observed that butter is made (for the use of Europeans only; the words used by the Malays, for butter and cheese, monteiga and queijo, being pure Portuguese) not as with us, by churning, but by letting the milk stand till the butter forms of itself on the top. It is then taken off with a spoon, stirred about with the same in a flat vessel, and well washed in two or three waters. The thick sour milk left at the bottom, when the butter or cream is removed, is the curd here meant. This must be well squeezed, formed into cakes, and left to dry, when it will grow nearly as hard as flint. For use, you must scrape some of it off, mix it with quick lime, and moisten it with milk. I think there is no stronger cement in the world, and it is found to hold, particularly in a hot and damp climate, much better than glue; proving also effectual in mending china-ware. The viscous juice of the saga-pea (abrus) is likewise used in the country as a cement.

Ink is made by mixing lamp-black with the white of egg. To procure the former they suspend over a burning lamp an earthen pot, the bottom of which is moistened, in order to make the soot adhere to it.
Painting and drawing they are quite strangers to. In carving, both in wood and ivory, they are curious and fanciful, but their designs are always grotesque and out of nature. The handles of the krises are the most common subjects of their ingenuity in this art, which usually exhibit the head and beak of a bird, with the folded arms of a human creature, not unlike the representation of one of the Egyptian deities. In cane and basket work they are particularly neat and expert; as well as in mats, of which some kinds are much prized for their extreme fineness and ornamental borders.

Silk and cotton cloths, of varied colours, manufactured by themselves, are worn by the natives in all parts of the country; especially by the women. Some of their work is very fine, and the patterns prettily fancied. Their loom or apparatus for weaving (tunun) is extremely defective, and renders their progress tedious. One end of the warp being made fast to a frame, the whole is kept tight, and the web stretched out by means of a species of yoke, which is fastened behind the body, when the person weaving sits down. Every second of the longitudinal threads, or warp, passes separately through a set of reeds, like the teeth of a comb, and the alternate ones through another set. These cross each other, up and down, to admit the woof, not from the extremities, as in our looms, nor effected by the feet, but by turning edge-ways two flat sticks which pass between them. The shuttle (turak) is a hollow reed, about sixteen inches long, generally ornamented on the outside, and closed at one end, having in it a small bit of stick, on which is rolled the woof or shoot. The silk cloths have usually a gold head. They use sometimes another kind of loom, still more simple than this, being no more than a frame in which the warp is fixed, and the woof darned with a long, small-pointed shuttle. For spinning the cotton they make use of a machine very like ours. The women are expert at embroidery, the gold and silver thread for which is procured from China, as well as their needles. For common work, their thread is the pulas before mentioned, or else filaments of the pisang (musa).

Different kinds of earthenware, I have elsewhere observed, are manufactured in the island.

They
They have a practice of perfuming their hair with oil of benzoin, which they distil themselves from the gum, by a process doubtless of their own invention. In procuring it, a priuk, or earthen rice pot, covered close, is used for a retort. A small bamboo is inserted in the side of the vessel, and well luted with clay and ashes, from which the oil drops as it comes over. Along with the benzoin they put into the retort, a mixture of sugar cane and other articles, that contribute little or nothing to the quantity or quality of the distillation; but no liquid is added. This oil is valued among them at a high price, and can only be used by the superior rank of people.

The oil in general use is that of the coconut, which is procured in the following manner. The fleshy part being scraped out of the nut, which for this use must be old, is exposed for some time to the heat of the sun. It is then put into a mat bag, and placed in the press (kampahan) between two sloping timbers, which are fixed together in a socket in the lower part of the frame, and forced towards each other by wedges in a groove at top, compressing by this means the pulp of the nut, which yields an oil, that falls into a trough made for its reception below. In the farther parts of the country, this oil also, owing to the scarcity of coconuts, is dear, and not so much used for burning as that from other vegetables, and the dammar or rosin, which is always at hand. When travelling at night they make use of torches or links, called suluh, the common sort of which are nothing more than dried bamboos of a convenient length, beaten at the joints, till split in every part, without the addition of any resinous or other inflammable substance. A superior kind is made by filling with dammar a young bamboo, about a cubit long, well dried, and having the outer skin taken off.

These torches are carried with a view, chiefly, to frighten away the tigers, which are alarmed at the appearance of fire; and for the same reason it is common to make a blaze with wood, in different parts round their villages. The tigers prove to the inhabitants, both in their journeys and even their domestic occupations, most fatal and destructive enemies. The number of people annually slain by these rapacious tyrants of the woods, is almost incredible. I have known instances of
whole villages being depopulated by them. Yet, from a superstitious prejudice, it is with difficulty they are prevailed upon, by a large reward which the India Company offers, to use methods of destroying them, till they have sustained some particular injury in their own family or kindred, and their ideas of fatalism contribute to render them insensible to the risk. Their traps, of which they can make variety, are very ingeniously contrived. Sometimes they are in the nature of strong cages, with falling doors, into which the beast is enticed by a goat or dog enclosed as a bait; sometimes they manage that a large timber shall fall, in a groove, across his back; he is noosed about the loins with strong rattans, or he is led to ascend a plank, nearly balanced, which, turning when he is past the centre, lets him fall upon sharp stakes prepared below. Instances have occurred of a tiger being caught by one of the former modes, which had many marks in his body of the partial success of this last expedient. The escapes, at times, made from them by the natives are surprising, but these accounts in general carry too romantic an air to admit of being repeated as facts. The size and strength of the species which prevails on this island are prodigious. They are said to break with a stroke of their fore paw, the leg of a horse or a buffalo; and the largest prey they kill is without difficulty dragged by them into the woods. This they usually perform on the second night, being supposed, on the first, to gratify themselves with sucking the blood only. Time is by this delay afforded to prepare for their destruction; and to the methods already enumerated, beside shooting them, I should add that of placing a vessel of water, strongly impregnated with arsenic, near the carcase, which is fastened to a tree to prevent its being carried off. The tiger having satiated himself with the flesh, is prompted to assuage his thirst with the tempting liquor at hand, and perishes in the indulgence. Their chief subsistence is most probably the unfortunate monkeys with which the woods abound. They are described as alluring them to their fate, by a fascinating power, similar to what has been supposed of the snake, and I am not incredulous enough to treat the idea with contempt, having myself observed that when an alligator, in a river, comes under an overhanging bough of a tree, the monkeys, in a state of alarm and distraction, crowd to the extremity, and chattering and trembling, approach nearer and nearer to the amphibious monster that waits to devour them.
them as they drop, which their fright and number renders almost unavoidable. These alligators likewise occasion the loss of many inhabitants, frequently destroying the people as they bathe in the river, according to their regular custom, and which the perpetual evidence of the risk attending it cannot deter them from. A superstitious idea of their sanctity also (or, perhaps, of consanguinity, as related in the journal of the Endeavour’s voyage) preserves these destructive animals from molestation, although, with a hook of sufficient strength, they may be taken without much difficulty. A musket ball appears to have no effect upon their impenetrable hides.

Besides the common methods of taking fish, of which the seas that wash the coasts of Sumatra afford an extraordinary variety and abundance, the natives employ a mode, unpractised, I apprehend, in any part of Europe. They steep the root of a certain climbing plant, called *tuba*, of strong narcotic qualities, in the water where the fish are observed, which produces such an effect, that they become intoxicated and to appearance dead, float on the surface of the water, and are taken with the hand. This is generally made use of in the basons of water, formed by the ledges of coral rock which, having no outlet, are left full when the tide has ebbed. In the manufacture and employment of the casting-net they are particularly expert, and scarcely a family near the sea-coast is without one. To supply this demand, great quantities of the *pulas* twine are brought down from the hill-country to be there worked up; and in this article we have an opportunity of observing the effect of that conformation which renders the handy-work of orientals (unassisted by machinery) so much more delicate than that of the western people. Mr. Crisp

* In Capain Cook’s second voyage is a plate representing a plant used for the same purpose at Otaheite, which is the exact delineation of one whose appearance I was well acquainted with in Sumatra, and which abounds in many parts of the sea-beach; but which is a different plant from the *tuba-akar*, but may be another kind, named *tuba-biji*. In South America also, we are informed, the inhabitants procure fish after this extraordinary manner, employing three different kinds of plants; but whether any of them be the same with that of Otaheite or Sumatra, I am ignorant. I have lately been informed that this practice is not unknown in England, but has been prohibited. It is termed “foxing:” the drug made use of was the *coculus indicus*. 
Crisp possessed a net of silk, made in the country behind Padang, the meshes of which were no wider than a small finger-nail, that opened sixteen feet in diameter. With such they are said to catch small fish in the extensive lake situated on the borders of Menangkabau. Birds, particularly the plover (cheruling) and quails (puyu) are caught by snares or springes laid for them in the grass. These are of iju, which resembles horsehair, many fathoms in length, and disposed in such a manner as to entangle their feet; for which purpose they are gently driven towards the snares. In some parts of the country they make use of clasp-nets. I never observed a Sumatran to fire a shot at a bird, though many of them, as well as the more eastern people, have a remarkably fine aim; but the mode of letting off the match-locks, which are the pieces most habitual to them, precludes the possibility of shooting flying. Gunpowder is manufactured in various parts of the island, but less in the southern provinces than amongst the people of Menangkabau, the Battas, and Achinese, whose frequent wars demand large supplies. It appears, however, by an agreement upon record, formed in 1728, that the inhabitants of Anak-sunígei were restricted from the manufacture, which they are stated to have carried to a considerable extent. It is made, as with us, of proportions of charcoal, sulphur, and nitre, but the composition is very imperfectly granulated, being often hastily prepared, in small quantities, for immediate use. The last article, though found in the greatest quantity in the salt-petre-caves before spoken of, is most commonly procured from goat’s dung, which is always to be had in plenty.

Sugar (as has already been observed) is commonly made, for domestic use, from the juice of a species of palm, boiled till a consistence is formed, but scarcely at all granulated, being little more than a thick syrup. This spread upon leaves to dry, made into cakes, and afterwards folded up in a peculiar vegetable substance, called upih, which is the sheath that envelopes the branch of the pinang tree, where it is inserted in the stem. In this state it is called jaggri, and beside its ordinary uses as sugar, it is mixed with chunam in making cement for buildings, and that exquisite plaster for walls which, on the coast of Coromandel, equals Parian marble in whiteness and polish. But in many parts of the island
Sugar is also made from the sugar-cane. The rollers of the mill used for this purpose are worked by the endless screw instead of cogs, and are turned with the hand, by means of a bar passing through one of the rollers which is higher than the other. As an article of traffic amongst the natives it is not considerable, nor have they the art of distilling arrack, the basis of which is molasses, along with the juice of the anau or of the coconut palm in a state of fermentation. Both, however, are manufactured by Europeans. 

Salt is here, as in most other countries, an article of general consumption. The demand for it is mostly supplied by cargoes imported, but they also manufacture it themselves. The method is tedious. They kindle a fire close to the sea beach, and gradually pour upon it sea water. When this has been continued for a certain time, the water evaporating, and the salt being precipitated among the ashes, they gather these in baskets, or in funnels made of the bark or leaves of trees, and again pour sea water on them, till the particles of salt are well separated, and pass, with the water, into a vessel placed below to receive them. This water, now strongly impregnated, is boiled till the salt adheres in a thick crust to the bottom and sides of the vessel. In burning a square fathom of firewood, a skilful person procures about five gallons of salt. What is thus made, has so considerable a mixture of the salt of the wood, that it soon dissolves, and cannot be carried far into the country. The coarsest grain is preferred.

The art of medicine, among the Sumatrans, consists almost entirely in

*Many attempts have been made by the English to bring to perfection the manufacture of sugar and arrack from the canes; but the expenses, particularly of the slaves, were always found to exceed the advantages. Within these few years (about 1777) that the plantations and works were committed to the management of Mr. Henry Botham, it has manifestly appeared that the end is to be obtained, by employing the Chinese in the works of the field, and allowing them a proportion of the produce, for their labour. The manufacture had arrived at considerable perfection, when the breaking out of war gave a check to its progress; but the path is pointed out, and it may be worth pursuing. The sums of money thrown into Batavia for arrack and sugar have been immense.*
in the application of simples, in the virtues of which they are well skil-
led. Every old man and woman is a physician, and their rewards de-
pend upon their success; but they generally procure a small sum in
advance, under the pretext of purchasing charms. The mode of prac-
tice is either by administering the juices of certain trees and herbs in-
wardly, or by applying outwardly a poultice of leaves chopped small,
upon the breast or part affected, renewing it as soon as it becomes dry.
For internal pains, they rub oil on a large leaf of a stimulant quality,
and heating it before the fire, clap it on the body of the patient, as a
blister, which produces very powerful effects. Bleeding they never use,
but the people of the neighbouring island of Nias are famous for their
skill in cupping, which they practise in a manner peculiar to them-
selves.

In fevers they give a decoction of the herb lakūn, and bathe the pa-
tient, for two or three mornings, in warm water. If this does not prove
effectual, they pour over him, during the paroxysm, a quantity of cold
water, rendered more chilly by the dawn sēdīṅgīn (cotyledon laciniata)
which, from the sudden revulsion it causes, brings on a copious perspi-
ration. Pains and swellings in the limbs are likewise cured by sweating;
but for this purpose, they either cover themselves over with mats, and
sit in the sunshine at noon, or if the operation be performed within
doors,

* Charms are there hung about the necks of children, as in Europe, and also worn by
persons whose situations expose them to risk. They are long narrow scrolls of paper, filled
with incoherent scraps of verse, which are separated from each other by a variety of fanci-
ful drawings. A charm against an ague I once accidentally met with, which from circum-
stances I conclude to be a translation of such as are employed by the Portuguese Christians
in India. Though not properly belonging to my subject, I present it to the reader. "(Sign
of the cross). When Christ saw the cross he trembled and shaked; and they said unto him
hast thou an ague? and he said unto them, I have neither ague nor fever; and whosoever
hears these words, either in writing or in mind, shall never be troubled with ague or fever.
So help thy servants, O Lord, who put their trust in thee!" From the many folds that ap-
pear in the original, I have reason to apprehend that it had been worn, and by some Eng-
lishmen, whom frequent sickness and the fond love of life, had rendered weak and supersti-
tious enough to try the effects of this barbarous and ridiculous quackery.
doors, a lamp, and sometimes a pot of boiling herbs, is enclosed in the covering with them.

Leprosy.

There are two species of leprosy known in these parts. The milder sort, or impetigo, as I apprehend it to be, is very common among the inhabitants of Nias; great numbers of whom are covered with a white scurf or scales, that renders them loathsome to the sight. But this distemper, though disagreeable from the violent itching and other inconveniences with which it is attended, does not appear immediately to affect the health; slaves in that situation being bought and sold for field and other out-door work. It is communicated from parents to their offspring, but though hereditary, it is not contagious. I have sometimes been induced to think it nothing more than a confirmed stage of the serpigo or ringworm, or it may be the same with what is elsewhere termed the shingles. I have known a Nias man who has effected a temporary removal of this scurf, by the frequent application of the goitinggang or daun kurap (cassia alata) and such other herbs as are used to cure the ringworm, and sometimes by rubbing gunpowder and strong acids to his skin; but it always returned after some time. The other species with which the country people are in some instances affected, is doubtless, from the description given of its dreadful symptoms, that severe kind of leprosy which has been termed elephantiasis, and is particularly described in the Asiat. Res. Vol. II. the skin coming off in flakes, and the flesh falling from the bones, as in the lues venerea. This disorder being esteemed highly infectious, the unhappy wretch who labours under it, is driven from the village he belonged to, into the woods, where victuals are left for him, from time to time, by his relations. A prang and a knife are likewise delivered to him, that he may build himself a hut, which is generally erected near to some river or lake, continual bathing being supposed to have some effect in removing the disorder, or alleviating the misery of the patient. Few instances of recovery have been known. There is a disease called the nambi which bears some affinity to this, attacking the feet chiefly, the flesh of which it eats away. As none but the lowest class of people seem to suffer from this complaint, I imagine it proceeds in a great degree from want of cleanliness.

The
The small pox (katumbuhan) sometimes visits the island and makes small-pox terrible ravages. It is regarded as a plague, and drives from the country thousands whom the infection spares. Their method of stopping its progress (for they do not attempt a cure) is by converting into an hospital or receptacle for the rest, that village where lie the greatest number of sick, whither they send all who are attacked by the disorder, from the country round. The most effectual methods are pursued to prevent any person's escape from this village, which is burnt to the ground as soon as the infection has spent itself, or devoured all the victims thus offered to it. Inoculation was an idea long unthought of, and as it could not be universal, it was held to be a dangerous experiment for Europeans to introduce it partially, in a country where the disorder makes its appearance at distant intervals only; unless those periods could be seized, and the attempts made, when and where there might be well founded apprehension of its being communicated in the natural way. Such an opportunity presented itself in 1780, when great numbers of people (estimated at a third of the population) were swept away in the course of that and the two following years; whilst upon those under the immediate influence of the English and Dutch settlements inoculation was practised with great success. I trust that the preventive blessing of vaccination has or will be extended to a country so liable to be afflicted with this dreadful scourge. A distemper called chachar, much resembling the small pox, and in its first stages mistaken for it, is not uncommon. It causes an alarm, but does not prove mortal, and is probably what we term the chicken pox.

The venereal disease, though common in the Malay bazars, is in the inland country almost unknown. A man returning to his village with the infection, is shunned by the inhabitants as an unclean and interdicted person. The Malays are supposed to cure it with the decoction of a china root, called by them gadong, which causes a salivation.

When a man is by sickness, or otherwise, deprived of his reason, or when subject to convulsion fits, they imagine him possessed by an evil spirit, and their ceremony of exorcism is performed by putting the unfortunate wretch into a hut, which they set fire to about his ears, suffering
ing him to make his escape through the flames in the best manner he can. The fright, which would go nigh to destroy the intellects of a reasonable man, may perhaps have, under contrary circumstances, an opposite effect.

The skill of the Sumatrans in any of the sciences, is, as may be presumed, very limited. Some, however, I have met with, who, in arithmetic, could multiply and divide, by a single multiplier or divisor, several places of figures. Tens of thousands ($laksa$) are the highest class of numbers the Malay language has a name for. In counting over a quantity of small articles, each tenth, and afterwards each hundredth piece, is put aside; which method is consonant with the progress of scientific numeration, and probably gave it origin. When they may have occasion to recollect at a distance of time, the tale of any commodities they are carrying to market, or the like, the country people often assist their memory by tying knots on a string, which is produced when they want to specify the number. The Peruvian $quipos$ were, I suppose, an improvement upon this simple invention.

They estimate the quantity of most species of merchandize by what we call dry measure, the use of weights, as applied to bulky articles, being apparently introduced among them by foreigners; for the $pikul$ and $catti$ are used only on the sea coast, and places which the Malays frequent. The $kulah$ or bamboo, containing very nearly a gallon, is the general standard of measure among the Rejangs; of these eight hundred make a $koyan$: the $chupah$ is one quarter of a bamboo. By this measure almost all articles, even elephants' teeth, are bought and sold; but by a bamboo of ivory they mean so much as is equal in weight to a bamboo of rice. This still includes the idea of weight, but is not attended with their principal objection to that mode of ascertaining quantity, which arises, as they say, from the impossibility of judging by the eye of the justness of artificial weights, owing to the various materials of which they may be composed, and to which measurement is not liable. The measures of length here, as perhaps originally among every people upon earth, are taken from the dimensions of the human body. The $deppa$, or fathom, is the extent of the arms from each extremity of the fingers: the
the *etta*, *asta*, or cubit, is the fore-arm and hand; *kaki* is the foot; *jajigka* is the span; and *jarri*, which signifies a finger, is the inch. These are estimated from the general proportions of middle-sized men, others making an allowance in measuring, and not regulated by an exact standard.

The ideas of geography, among such of them as do not frequent the sea, are perfectly confined, or rather they entertain none. Few of them know that the country they inhabit is an island, or have any general name for it. Habit renders them expert in travelling through the woods, where they perform journeys of weeks and months without seeing a dwelling. In places little frequented, where they have occasion to strike out new paths, (for roads there are none) they make marks on trees, for the future guidance of themselves and others. I have heard a man say, "I will attempt a passage by such a route, for my father, when living, told me that he had left his tokens there." They estimate the distance of places from each other, by the number of days, or the proportion of the day, taken up in travelling it, and not by measurement of the space. Their journey, or day's walk, may be computed at about twenty miles; but they can bear a long continuance of fatigue.

The Malays, as well as the Arabs and other Mahometan nations, fix the length of the year at three hundred and fifty-four days, or twelve lunar months of twenty-nine days and an half; by which mode of reckoning, each year is thrown back about eleven days. The original Sumatrans rudely estimate their annual periods from the revolution of the seasons, and count their years from the number of their crops of grain (*taun padi*); a practice, which, though not pretending to accuracy, is much more useful for the general purposes of life, than the lunar period, which is merely adapted to religious observances. They, as well as the Malays, compute time by lunations, but do not attempt to trace any relation or correspondence, between these smaller measures and the solar revolution. Whilst more polished nations were multiplying mistakes and difficulties, in their endeavours to ascertain the completion of the sun's course through the ecliptic, and in the mean while suffering their
their nominal seasons to become almost the reverse of nature, these people, without an idea of intercalation, preserved, in a rude way, the account of their years free from essential, or at least progressive error, and the confusion which attends it. The division of the month into weeks I believe to be unknown, except where it has been taught with Mahometanism; the day of the moon's age being used instead of it, where accuracy is required; nor do they subdivide the day into hours. To denote the time of day, at which any circumstance they find it necessary to speak of, happened, they point with their finger to the height in the sky at which the sun then stood. And this mode is the more general and precise, as the sun, so near the equator, ascends and descends almost perpendicularly, and rises and sets, at all seasons of the year, within a few minutes of six o'clock. Scarcely any of the stars or constellations are distinguished by them. They notice, however, the planet Venus, but do not imagine her to be the same at the different periods of her revolution; when she precedes the rising, and follows the setting sun. They are aware of the night on which the new moon should make its appearance, and the Malays salute it with the discharge of guns. They also know when to expect the returns of the tides, which are at their height, on the south-western coast of the island, when that luminary is in the horizon, and ebb as it rises. When they observe a bright star near the moon (or rubbing against her, as they express it), they are apprehensive of a storm; as European sailors foretell a gale from the sharpness of her horns. These are both, in part, the consequence of an unusual clearness in the air, which, proceeding from an extraordinary alteration of the state of the atmosphere, may naturally be followed by a violent rushing of the circumjacent parts, to restore the equilibrium, and thus prove the prognostic of high wind. During an eclipse they make a loud noise with sounding instruments, to prevent one luminary from devouring the other, as the Chinese, to frighten away the dragon; a superstition that has its source in the ancient systems of astronomy (particularly the Hindu) where the nodes of the moon are identified with the dragon's head and tail. They tell of a man in the moon, who is continually employed in spinning cotton, but that every night a rat gnaws his thread, and obliges him to begin his work afresh. This they apply as an emblem of
endless and ineffectual labour, like the stone of Sisyphus, and the sieves of the Danaides.

With history and chronology the country people are but little acquainted; the memory of past events being preserved by tradition only.

They are fond of music, and have many instruments in use among them, but few, upon inquiry, appear to be original, being mostly borrowed from the Chinese and other more eastern people; particularly the kalintang, gong, and sulin. The violin has found its way to them from the westward. The kalintang resembles the sticcardo and the harmonica; the more common ones having the cross pieces, which are struck with two little hammers, of split bamboo, and the more perfect, of a certain composition of metal which is very sonorous. The gongs, a kind of bell, but differing much in shape, and struck on the outside, are cast in sets regularly tuned to thirds, fourth, fifth, and octave, and often serve as a bass, or under part, to the kalintang. They are also sounded for the purpose of calling together the inhabitants of the village upon any particular occasion; but the more ancient and still common instrument for this use, is a hollowed log of wood, named katut. The sulin is the Malayan flute. The country flute is called serdum. It is made of bamboo, is very imperfect, having but few stops, and resembles much an instrument described as found among the people of Otaheite. A single hole underneath, is covered with the thumb of the left hand, and the hole nearest the end at which it is blown, on the upper side, with a finger of the same hand. The other two holes are stoped with the right hand fingers. In blowing they hold it inclined to the right side. They have various instruments of the drum kind, particularly those called tingkah, which are in pairs, and beaten with the hands at each end. They are made of a certain kind of wood hollowed out, covered with dried goat-skins, and laced with split rattans. It is difficult to obtain a proper knowledge of their division of the scale, as they know nothing of it in theory. The interval we call an octave, seems to be divided with them into six tones, without any intermediate semitones, which must confine their music to one key. It consists in general of but few notes, and the third is the interval that most frequently occurs. Those who perform

2 C 2
on the violin, use the same notes as in our division, and they tune the instrument, by fifths, to a great nicety. They are fond of playing the octave, but scarcely use any other chord. The Sumatran tunes very much resemble, to my ear, those of the native Irish, and have usually, like them, a flat third: the same has been observed of the music of Bengal, and, probably, it will be found that the minor key obtains a preference amongst all people at a certain stage of civilization.
Languages—Malayan—Arabic character used—Languages of the interior people—Peculiar characters—Specimens of languages and of alphabets.

Before I proceed to an account of the laws, customs, and manners of the people of the island, it is necessary that I should say something of the different languages spoken on it; the diversity of which has been the subject of much contemplation and conjecture.

The Malayan language, which has commonly been supposed original in the peninsula of Malayo, and from thence to have extended itself throughout the eastern islands, so as to become the lingua franca of that part of the globe, is spoken every where along the coasts of Sumatra, prevails without the mixture of any other, in the inland country of Me-nanjangkabau and its immediate dependencies, and is understood in almost every part of the island. It has been much celebrated, and justly, for the smoothness and sweetness of its sound, which have gained it the appellation of the Italian of the East. This is owing to the prevalence of vowels and liquids in the words (with many nasals which may be thought an objection) and the infrequency of any harsh combination of mute consonants. These qualities render it well adapted to poetry, which the Malays are passionately addicted to. They amuse all their leisure hours, including the greater portion of their lives, with the repetition of songs which are, for the most part, proverbs illustrated, or figures of speech applied to the occurrences of life. Some that they rehearse, in a kind of recitative, at their bimbangs or feasts, are historical love tales, like our old English ballads, and are often extemporaneous productions. An example of the former species is as follows:—

Apa guna passang palita,
Kallo tidah dañgan sambul'nia?
Apa guna bernine matta,
Kallo tidah dañgan sumggu'nia?

What
What signifies attempting to light a lamp,  
If the wick be wanting?  
What signifies playing with the eyes,  
If nothing in earnest be intended?

It must be observed, however, that it often proves a very difficult matter to trace the connexion between the figurative and the literal sense of the stanza. The essentials in the composition of the pantun, for such these little pieces are called, the longer being called dendang, are the rhythmus and the figure, particularly the latter, which they consider as the life and spirit of the poetry. I had a proof of this in an attempt which I made to impose a pantun of my own composing on the natives, as a work of their countrymen. The subject was a dialogue between a lover and a rich, coy mistress: the expressions were proper to the occasion, and in some degree characteristic. It passed with several, but an old lady who was a more discerning critic than the others, remarked that it was "katta katta saja"—mere conversation; meaning that it was destitute of the quaint and figurative expressions which adorn their own poetry. Their language, in common speaking, is proverbial and sententious. If a young woman prove with child before marriage, they observe it is "daalu buah, kadian buniga"—"the fruit before the flower." Hearing of a person's death, they say, "nen matti, matti; nen idup, bekraja: kallo sampi janji'nia, apa buli buat?"—"Those who are dead, are dead; those who survive must work: if his allotted time was expired, what resource is there?" The latter phrase they always make use of, to express their sense of inevitability, and has more force than any translation of it I can employ.

Their writing is in the Arabic character, with modifications to adapt that alphabet to their language, and in consequence of the adoption of their religion from the same quarter, a great number of Arabic words are incorporated with the Malayan. The Portuguese too have furnished them with several terms, chiefly for such ideas as they have acquired since the period of European discoveries to the eastward. They write on paper, using ink of their own composition, with pens made of the twig of the anau tree. I could never discover that the Malays had any original written characters, peculiar to themselves, before they acquired those now
now in use; but it is possible that such might have been lost; a fate that may hereafter attend the Batta, Rejang, and others of Sumatra, on which the Arabic daily makes encroachments. Yet I have had frequent occasion to observe the former language written by inland people, in the country character; which would indicate that the speech is likely to perish first. The Malayan books are very numerous, both in prose and verse. Many of them are commentaries on the korân, and others, romances or heroic tales.

The purest or most elegant Malayan is said, and with great appearance of reason, to be spoken at Malacca. It differs from the dialect used in Sumatra chiefly in this, that words, in the latter, made to terminate in "o," are in the former, sounded as ending in "a." Thus they pronounce lada (pepper) instead of lado. Those words which end with "k" in writing, are, in Sumatra, always softened in speaking, by omitting it; as "tabbé banniâ," "many compliments," for "tabbek banniâk;" but the Malaccans, and especially the more eastern people, who speak a very broad dialect, give them generally the full sound. The personal pronouns also differ materially in the respective countries.

Attempts have been made to compose a grammar of this tongue, upon the principles on which those of the European languages are formed. But the inutility of such productions is obvious. Where there is no inflexion of either nouns or verbs, there can be no cases, declensions, moods, or conjugations. All this is performed by the addition of certain words expressive of a determinate meaning, which should not be considered as mere auxiliaries, or as particles subservient to other words. Thus, in the instance of rumah, a house; deri pada rumah signifies "from a house;" but it would be talking without use or meaning, to say that deri pada is the sign of the ablative case of that noun, for then every preposition should equally require an appropriate case, and as well as "of," "to," and "from," we should have a case for deâtaâs rumah "on top of the house." So of verbs: "kallo saya buli jalan" "If I could walk:" this may be termed the preter-imperfect tense of the subjunctive or potential mood, of the verb jalan; whereas it is in fact a sentence, of which
which *jalan*, *buli*, &c. are constituent words. It is improper, I say, to talk of the case of a noun, which does not change its termination, or the mood of a verb, which does not alter its form. An useful set of observations might be collected, for speaking the language with correctness and propriety, but they must be independent of the technical rules of languages founded on different principles.*

Beside the Malayan there are a variety of languages spoken in Sumatra, which, however, have not only a manifest affinity among themselves, but also to that general language which is found to prevail in, and to be indigenous to all the islands of the eastern sea; from Madagascar to the remotest of Captain Cook's discoveries; comprehending a wider extent than the Roman, or any other tongue, has yet boasted. Indisputable examples of this connexion and similarity, I have exhibited in a paper which the Society of Antiquaries have done me the honour to publish in their *Archæologia*, Vol. VI. In different places it has been more or less mixed and corrupted, but between the most dissimilar branches, an evident sameness of many radical words is apparent, and in some, very distant from each other in point of situation, as for instance the Philippines and Madagascar, the deviation of the words is scarcely more than is observed in the dialects of neighbouring provinces of the same kingdom. To render this comparison of languages more extensive, and, if possible, to bring all those spoken throughout the world, into one point of view, is an object of which I have never lost sight, but my hopes of completing such a work are by no means sanguine.

The principal of these Sumatran languages are the *Batta*, the *Rejang*, and the *Lampong*, whose difference is marked, not so much by the want of correspondence in the terms, as by the circumstance of their being expressed in distinct and peculiar written characters. But whether this apparent difference be radical and essential, or only produced by accident

*I have ventured to make this attempt, and have also prepared a Dictionary of the language, which it is my intention to print with as little delay as circumstances will admit.*
dent and the lapse of time, may be thought to admit of doubt; and in order that the reader may be enabled to form his own judgment, a plate containing the Alphabetical characters of each, with the mode of applying the orthographical marks to those of the Rejang language in particular, is annexed. It would indeed be extraordinary, and perhaps singular in the history of human improvement, that divisions of people in the same island, with equal claims to originality, in stages of civilization nearly equal, and speaking languages derived from the same source, should employ characters different from each other, as well as from the rest of the world. It will be found, however, that the alphabet used in the neighbouring island of Java (given by Corneille Le Brun), that used by the Tagala people of the Philippines (given by Thevenot), and by the Bugis people of Celebes (given by Capt. Forrest), vary at least as much from these and from each other, as the Rejang from the Batta. The Sanskrit scholar will at the same time perceive in several of them an analogy to the rythmical arrangement, terminating with a nasal, which distinguishes the alphabet of that ancient language, whose influence is known to have been extensive in this quarter. In the country of Achin, where the language differs considerably from the Malayan, the Arabic character has nevertheless been adopted, and on this account it has less claim to originality.

Their manuscripts of any bulk and importance are written with ink of their own making, on the inner bark of a tree cut into slips of several feet in length, and folded together in squares; each square or fold answering to a page or leaf. For more common occasions they write on the outer coat of a joint of bamboo, sometimes whole, but generally split into pieces of two or three inches in breadth, with the point of the weapon worn at their side, which serves the purpose of a stylus; and these writings, or scratchings rather, are often performed with a considerable degree of neatness. Thus the Chinese also are said by their historians to have written on pieces of bamboo, before they invented paper. Of both kinds of manuscript, I have many specimens in my possession. The lines are formed from the left hand towards the right, contrary to the practice of the Malays and the Arabians.
In Java, Siam, and other parts of the East, beside the common language of the country, there is established a court language spoken by persons of rank only; a distinction invented for the purpose of keeping the vulgar at a distance, and inspiring them with respect for what they do not understand. The Malays also have their bhasa dalam, or courtly style, which contains a number of expressions not familiarly used in common conversation or writing, but yet by no means constituting a separate language, any more than, in English, the elevated style of our poets and historians. Amongst the inhabitants of Sumatra in general, disparity of condition is not attended with much ceremonious distance of behaviour between the persons.

</table>

Considered as a people occupying a certain rank in the scale of civil society, it is not easy to determine the proper situation of the inhabitants of this island. Though far distant from that point to which the polished states of Europe have aspired, they yet look down, with an interval almost as great, on the savage tribes of Africa and America. Perhaps if we distinguish mankind summarily into five classes; but of which each would admit of numberless subdivisions; we might assign a third place, to the more civilized Sumatrans, and a fourth, to the remainder. In the first class, I should of course include some of the republics of ancient Greece, in the days of their splendour; the Romans, for some time before and after the Augustan age; France, England, and other refined nations of Europe, in the latter centuries; and perhaps China. The second might comprehend the great Asiatic empires at the period of their prosperity; Persia, the Mogul, the Turkish, with some European kingdoms. In the third class, along with the Sumatrans, and a few other states of the eastern archipelago, I should rank the nations on the northern coast of Africa, and the more polished Arabs. The fourth class, with the less civilized Sumatrans, will take in the people of the new discovered islands in the South Sea; perhaps the celebrated Mexican and Peruvian empires; the Tartar hordes, and all those societies of people in various parts of the globe, who, possessing personal property, and acknowledging some species of established subordination, rise one step above the Caribs, the New Hollanders, the Laplanders, and the Hottentots, who exhibit a picture of mankind in its rudest and most humiliating aspect.
SUMATRA.

As mankind are by nature so prone to imitation, it may seem surprising that these people have not derived a greater share of improvement, in manners and arts, from their long connection with Europeans, particularly with the English, who have now been settled among them for an hundred years. Though strongly attached to their own habits, they are nevertheless sensible of their inferiority, and readily admit the preference to which our attainments in science, and especially in mechanics, entitle us. I have heard a man exclaim, after contemplating the structure and uses of a house-clock, "Is it not fitting that such as we, should be slaves to people who have the ingenuity to invent, and the skill to construct, so wonderful a machine as this?" "The sun," he added, "is a machine of this nature." "But who winds it up?" said his companion. "Who but Allah," he replied. This admiration of our superior attainments is, however, not universal; for, upon an occasion similar to the above, a Sumatran observed, with a sneer, "How clever these people are in the art of getting money."

Some probable causes of this backwardness may be suggested. We carry on few or no species of manufacture at our settlements; every thing is imported ready wrought to its highest perfection; and the natives, therefore, have no opportunity of examining the first process, or the progress of the work. Abundantly supplied with every article of convenience from Europe, and prejudiced in their favour because from thence, we make but little use of the raw materials Sumatra affords. We do not spin its cotton; we do not rear its silk-worms; we do not smelt its metals; we do not even hew its stone: neglecting these, it is in vain we exhibit to the people, for their improvement in the arts, our rich brocades, our time-pieces, or display to them, in drawings, the elegance of our architecture. Our manners likewise are little calculated to excite their approval and imitation. Not to insist on the licentiousness that has at times been imputed to our communities; the pleasures of the table; emulation in wine; boisterous mirth; juvenile frolics, and puerile amusements, which do not pass without serious, perhaps contemptuous, animadversion—setting these aside, it appears to me, that even our best models are but ill adapted for the imitation of a rude, incurious, and unambitious people. Their senses, not their reason, should be acted on.
on, to rouse them from their lethargy; their imaginations must be warmed; a spirit of enthusiasm must pervade and animate them, before they will exchange the pleasures of indolence for those of industry. The philosophical influence that prevails, and characterizes the present age, in the western world, is unfavourable to the producing these effects. A modern man of sense and manners despises, or endeavours to despise, ceremony, parade, attendance, superfluous and splendid ornaments in his dress or furniture: preferring ease and convenience, to cumbersome pomp, the person first in rank is no longer distinguished by his apparel, his equipage, or his number of servants, from those inferior to him; and though possessing real power, is divested of almost every external mark of it. Even our religious worship partakes of the same simplicity. It is far from my intention to condemn or depreciate these manners, considered in a general scale of estimation. Probably, in proportion as the prejudices of sense are dissipated by the light of reason, we advance towards the highest degree of perfection our natures are capable of; possibly perfection may consist in a certain medium which we have already stept beyond; but certainly all this refinement is utterly incomprehensible to an uncivilized mind, which cannot discriminate the ideas of humility and meanness. We appear to the Sumatrans to have degenerated from the more splendid virtues of our predecessors. Even the richness of their laced suits, and the gravity of their perukes, attracted a degree of admiration; and I have heard the disuse of the large hoops worn by the ladies, pathetically lamented. The quick, and to them inexplicable, revolutions of our fashions, are subject of much astonishment, and they naturally conclude, that those modes can have but little intrinsic merit which we are so ready to change; or at least that our caprice renders us very incompetent to be the guides of their improvement. Indeed, in matters of this kind, it is not to be supposed that an imitation should take place, owing to the total incongruity of manners in other respects, and the dissimilarity of natural and local circumstances. But, perhaps, I am superfluously investigating minute and partial causes of an effect, which one general one may be thought sufficient to produce. Under the frigid, and more especially the torrid zone, the inhabitants will naturally preserve an uninterrupted similarity and consistency of manners, from the uniform influence of their climate. In the tem-
perate zones, where this influence is equivocal, the manners will be fluctuating, and dependent rather on moral than physical causes.

The Malays and the other native Sumatrans differ more in the features of their mind than in those of their person. Although we know not that this island, in the revolutions of human grandeur, ever made a distinguished figure in the history of the world (for the Achinese, though powerful in the sixteenth century, were very low in point of civilization) yet the Malay inhabitants have an appearance of degeneracy, and this renders their character totally different from that which we conceive of a savage, however justly their ferocious spirit of plunder on the eastern coast, may have drawn upon them that name. They seem rather to be sinking into obscurity, though with opportunities of improvement, than emerging from thence to a state of civil or political importance. They retain a strong share of pride, but not of that laudible kind which restrains men from the commission of mean and fraudulent actions. They possess much low cunning and plausible duplicity, and know how to dissemble the strongest passions and most inveterate antipathy, beneath the utmost composure of features, till the opportunity of gratifying their resentment offers. Veracity, gratitude, and integrity, are not to be found in the list of their virtues, and their minds are almost strangers to the sentiments of honour and infamy. They are jealous and vindictive. Their courage is desultory, the effect of a momentary enthusiasm, which enables them to perform deeds of incredible desperation; but they are strangers to that steady magnanimity, that cool heroic resolution in battle, which constitutes in our idea the perfection of this quality, and renders it a virtue.*

Yet it must be observed, that from an apathy almost paradoxical, they suffer under sentence of death, in cases where no indignant passions could operate to buoy up the mind to a contempt of punishment, with astonishing composure and indifference; uttering little more on these occasions, than a proverbial saying, common among them, expressive of the inevitability

* In the history of the Portuguese wars in this part of the East, there appear some exceptions to this remark, and particularly in the character of Laksamanna (his title of commander in chief being mistaken for his proper name), who was truly a great man and most consummate warrior.
tability of fate—"apa buli buat?" To this stoicism, their belief in predestination, and very imperfect ideas of a future, eternal existence, doubtless contribute.

Some writer has remarked, that a resemblance is usually found, between the disposition and qualities of the beasts proper to any country, and those of the indigenous inhabitants of the human species, where an intercourse with foreigners has not destroyed the genuineness of their character. The Malay may thus be compared to the buffalo and the tiger. In his domestic state, he is indolent, stubborn, and voluptuous as the former, and in his adventurous life, he is insidious, blood-thirsty, and rapacious as the latter. Thus also the Arab is said to resemble his camel, and the placid Hindu his cow.

The Sumatran of the interior country, though he partakes in some degree of the Malayan vices, and this partly from the contagion of example, possesses many exclusive virtues; but they are more properly of the negative than the positive kind. He is mild, peaceable, and forbearing, unless his anger be roused by violent provocation, when he is implacable in his resentments. He is temperate and sober, being equally abstemious in meat and drink. The diet of the natives is mostly vegetable; water is their only beverage; and though they will kill a fowl or a goat for a stranger, whom perhaps they never saw before, nor ever expect to see again, they are rarely guilty of that extravagance for themselves; nor even at their festivals (bimbang), where there is a plenty of meat, do they eat much of any thing but rice. Their hospitality is extreme, and bounded by their ability alone. Their manners are simple; they are generally, except among the chiefs, devoid of the Malay cunning and chicane; yet endued with a quickness of apprehension, and on many occasions discovering a considerable degree of penetration and sagacity. In respect to women, they are remarkably continent, without any share of insensibility. They are modest; particularly guarded in their expressions; courteous in their behaviour; grave in their deportment, being seldom or never excited to laughter; and patient to a great degree. On the other hand, they are litigious; indolent; addicted to gaming; dishonest in their dealings with strangers, which they esteem no moral defect; suspicious; regardless
regardless of truth; mean in their transactions; servile; though cleanly in their persons, dirty in their apparel, which they never wash. They are careless and improvident of the future, because their wants are few, for though poor, they are not necessitous; nature supplying, with extraordinary facility, whatever she has made requisite for their existence. Science and the arts have not, by extending their views, contributed to enlarge the circle of their desires; and the various refinements of luxury, which in polished societies become necessaries of life, are totally unknown to them. The Makassar and Bugis people, who come annually in their praus from Celebes to trade at Sumatra, are looked up to by the inhabitants, as their superiors in manners. The Malays affect to copy their style of dress, and frequent allusions to the feats and achievements of these people are made in their songs. Their reputation for courage, which certainly surpasses that of all other people in the eastern seas, acquires them this flattering distinction. They also derive part of the respect paid them, from the richness of the cargoes they import, and the spirit with which they spend the produce in gaming, cock-fighting, and opium-smoking.

Having endeavoured to trace the character of these people, with as much fidelity and accuracy as possible, I shall now proceed to give an account of their government, laws, customs, and manners; and, in order to convey to the reader the clearest ideas in my power, I shall develop the various circumstances in such order and connection as shall appear best to answer this intent, without confining myself, in every instance, to a rigid and scrupulous arrangement under distinct heads.

The Rejang people, whom, for reasons before assigned, I have fixed upon for a standard of description, but which apply generally to the orang ulu, or inhabitants of the inland country, are distinguished into tribes, the descendants of different ancestors. Of these there are four principal, who are said to trace their origin to four brothers, and to have been united from time immemorial in a league offensive and defensive; though it may be presumed, that the permanency of this bond of union is to be attributed rather to considerations of expediency resulting from their situation, than to consanguinity, or any formal compact. The in-
habitants live in villages, called dusun, each under the government of a head man or magistrate, styled dupati, whose dependants are termed his ana-buah, and in number seldom exceed one hundred. The dupatis belonging to each river (for here the villages being almost always situated by the water-side, the names we are used to apply to countries or districts, are properly those of the rivers) meet in a judicial capacity at the kwalo, where the European factory is established, and are then distinguished by the name of proailin. The pangeran (a Javanese title) or feudal chief of the country, presides over the whole. It is not an easy matter to describe in what consists the fealty of a dupati to his pangeran, or of his ana-buah to himself, so very little in either case is practically observed. Almost without arts, and with but little industry, the state of property is nearly equal among all the inhabitants, and the chiefs scarcely differ, but in title, from the bulk of the people. Their authority is no more than nominal, being without that coercive power, necessary to make themselves feared and implicitly obeyed. This is the natural result of poverty among nations habituated to peace; where the two great political engines, of interest and military force, are wanting. Their government is founded in opinion, and the submission of the people is voluntary. The domestic rule of a private family, beyond a doubt, suggested first the idea of government in society, and this people having made but small advances in civil policy, theirs continues to retain a strong resemblance of its original. It is connected also with the principle of the feudal system, into which it would probably settle, should it attain to a greater degree of refinement. All the other governments throughout the island are likewise a mixture of the patriarchal and feudal; and it may be observed, that where a spirit of conquest has reduced the inhabitants under the subjection of another power, or has added foreign districts to their dominion, there the feudal maxims prevail: where the natives, from situation or disposition, have long remained undisturbed by revolutions, there the simplicity of patriarchal rule obtains; which is not only the first, and natural form of government, of all rude nations rising from imperceptible beginnings, but is perhaps also the highest state of perfection at which they can ultimately arrive. It is not in this art alone that we perceive the next step from consummate refinement, leading to simplicity.
The foundation of right to government among these people, as I said, to be the general consent. If a chief exerts an undue authority, or departs from their long established customs and usages, they conceive themselves at liberty to relinquish their allegiance. A commanding aspect, an insinuating manner, a ready fluency in discourse, and a penetration and sagacity in unravelling the little intricacies of their disputes, are qualities which seldom fail to procure to their possessor respect and influence, sometimes, perhaps, superior to that of an acknowledged chief. The \textit{paňgeran}, indeed, claims despotic sway, and as far as he can find the means, scruples not to exert it; but his revenues being insufficient to enable him to keep up any force, for carrying his mandates into execution, his actual powers are very limited, and he has seldom found himself able to punish a turbulent subject, any otherwise than by private assassination. In appointing the heads of \textit{dusuns}, he does little more than confirm the choice already made among the inhabitants, and were he arbitrarily to name a person of a different tribe, or from another place, he would not be obeyed. He levies no tax, nor has any revenue, (what he derives from the India Company being out of the question) or other emolument from his subjects, than what accrues to him from the determination of causes. Appeals lie to him in all cases, and none of the inferior courts, or assemblies of \textit{proatlıns}, are competent to pronounce sentence of death. But all punishments being, by the laws of the country, commutable for fines, and the appeals being attended with expence and loss of time, the parties generally abide by the first decision. Those \textit{dusuns} which are situated nearest to the residence of the \textit{paňgeran}, at \textit{Suňgey-lamo}, acknowledge somewhat more of subordination than the distant ones, which, even in case of war, esteem themselves at liberty to assist or not, as they think proper, without being liable to consequences. In answer to a question on this point, "we are his subjects, not his slaves," replied one of the \textit{proatlıns}. But from the \textit{paňgeran} you hear a tale widely different. He has been known to say, in a political conversation; "such and such \textit{dusuns} there will be no trouble with; they are my powder and shot;" explaining himself by adding, that he could dispose of the inhabitants, as his ancestors had done, to purchase ammunition in time of war.
The father of Pańgeran Mańko Raja (whose name is preserved from oblivion by the part he took in the expulsion of the English from Fort Marlborough in the year 1719,) was the first who bore the title of pańgeran of Suńgay-lamo. He had before been simply Baginda Sabyam. Until about an hundred years ago, the southern coast of Sumatra, as far as Urei River, was dependant on the king of Bantam, whose jennang (lieutenant or deputy) came yearly to Silebar or Bencoolen, collected the pepper and filled up the vacancies, by nominating, or rather confirming in their appointments, the proatîns. Soon after that time, the English having established a settlement at Bencoolen, the jennang informed the chiefs that he should visit them no more, and raising the two head men of Suńgey-lamo and Suńgey-itam, (the latter of whom is chief of the Lemba country, in the neighbourhood of Bencoolen River; on which, however, the former possesses some villages, and is chief of the Rejang tribes) to the dignity of pańgeran, gave into their hands the government of the country, and withdrew his master's claim. Such is the account given by the present possessors, of the origin of their titles, which nearly corresponds with the recorded transactions of the period. It followed naturally that the chief thus invested should lay claim to the absolute authority of the king whom he represented, and, on the other hand, that the proatîns should still consider him but as one of themselves, and pay him little more than nominal obedience. He had no power to enforce his plea, and they retain their privileges, taking no oath of allegiance, nor submitting to be bound by any positive engagement. They speak of him, however, with respect, and in any moderate requisition, that does not affect their adat or customs, they are ready enough to aid him, (to-long, as they express it) but rather as matter of favour than acknowledged obligation.

The exemption from absolute subjection, which the dupatis contend for, they allow in turn to their ana-buahs, whom they govern by the influence of opinion only. The respect paid to one of these, is little more than as to an elder of a family held in esteem, and this the old men of the dusun share with him, sitting by his side in judgment on the little differences that arise among themselves. If they cannot determine the cause,
cause, or the dispute be with one of a separate village, the neighbouring proattitus of the same tribe meet for the purpose. From these litigations arise some small emoluments to the dupati, whose dignity, in other respects, is rather an expense than an advantage. In the erection of public works, such as the ballei or town-hall, he contributes a larger share of materials. He receives and entertains all strangers, his dependants furnishing their quotas of provision, on particular occasions; and their hospitality is such, that food and lodging are never refused to those by whom they are required.

Though the rank of dupati is not strictly hereditary, the son, when of age, and capable, generally succeeds the father, at his decease: if too young, the father’s brother, or such one of the family as appears most qualified, assumes the post; not as a regent, but in his own right; and the minor comes in, perhaps, at the next vacancy. If this settlement happens to displease any portion of the inhabitants, they determine amongst themselves what chief they will follow, and remove to his village, or a few families, separating themselves from the rest, elect a chief; but without contesting the right of him whom they leave. The chiefs, when nominated, do not, however, assume the title of dupati, until confirmed by the pangeran, or by the Company’s Resident. On every river there is at least one superior proatfin, termed a pambarab, who is chosen by the rest, and has the right or duty of presiding at those suits and festivals in which two or more villages are concerned, with a larger allotment of the fines, and (like Homer’s distinguished heroes) of the provisions also. If more tribes than one are settled on the same river, each has usually its pambarab. Not only the rivers or districts, but, indeed, each dusun, is independent of, though not unconnected with, its neighbours; acting in concert with them by specific consent.

The system of government among the people near the sea-coast, who, towards the southern extreme of the island, are the planters of pepper, is much influenced by the power of the Europeans, who are virtually the lords paramount, and exercise, in fact, many of the functions of sovereignty. The advantages derived to the subject from their sway, both in a political and civil sense, are infinitely greater than persons at a distance
a distance are usually inclined to suppose. Oppressions may be sometimes complained of at the hands of individuals, but, to the honour of the Company's service let me add, they have been very rare, and of inconsiderable magnitude. Where a degree of discretionary power is intrusted to single persons, abuses will, in the nature of things, arise in some instances; cases may occur, in which the private passions of the Resident will interfere with his public duty; but the door has ever been open for redress, and examples have been made. To destroy this influence and authority, in order to prevent these consequences, were to cut off a limb in order to remove a partial complaint. By the Company's power, the districts over which it extends are preserved in uninterrupted peace. Were it not for this power, every dusun of every river would be at war with its neighbour. The natives themselves allow it, and it was evinced, even in the short space of time during which the English were absent from the coast, in a former war with France. Hostilities of district against district, so frequent among the independent nations to the northward, are, within the Company's jurisdiction, things unheard of; and those dismal catastrophes, which in all the Malayan islands are wont to attend on private feuds, but very rarely happen. "I tell you honestly," said a dupati, much irritated against one of his neighbours, "that it is only you," pointing to the Resident of Laye, "that prevents my plunging this weapon into his breast." The Resident is also considered as the protector of the people from the injustice and oppression of the chiefs. This oppression, though not carried on in the way of open force, which the ill-defined nature of their authority would not support, is scarcely less grievous to the sufferer. Expounders of the law, and deeply versed in the chicanery of it, they are ever lying in wait to take advantage of the necessitous and ignorant, till they have stripped them of their property, their family, and their personal liberty. To prevent these practices; the partial administration of justice in consequence of bribes; the subornation of witnesses; and the like iniquities; a continual exertion of the Resident's attention and authority is required; and as that authority is accidentally relaxed, the country falls into confusion.

It is true, that this interference is not strictly consonant with the spirit
spirit of the original contracts entered into by the Company with the native chiefs; who, in consideration of protection from their enemies; regular purchase of the produce of their country; and a gratuity to themselves, proportioned to the quantity of that produce, undertake, on their part, to oblige their dependants to plant pepper; to refrain from the use of opium, the practice of gaming, and other vicious excesses; and to punish them in case of non-compliance. But however prudent or equal these contracts might have been at the time their form was established, a change of circumstances; the gradual and necessary increase of the Company’s sway, which the peace and good of the country required; and the tacit consent of the chiefs themselves, (among whom the oldest living have never been used to regard the Company, who have conferred on them their respective dignities, as their equals, or as trading in their districts upon sufferance) have long antiquated them; and custom and experience have introduced in their room, an influence on one side, and a subordination on the other, more consistent with the power of the Company, and more suitable to the benefits derived from the moderate and humane exercise of that power. Prescription has given its sanction to this change, and the people have submitted to it without murmuring; as it was introduced, not suddenly, but with the natural course of events, and bettered the condition of the whole while it tended to curb the rapacity of the few. Then let not short-sighted or designing persons, upon false principles of justice, or ill-digested notions of liberty, rashly endeavour to overturn a scheme of government, doubtless not perfect, but which seems best adapted to the circumstances it has respect to, and attended with the fewest disadvantages. Let them not vainly exert themselves to procure redress of imaginary grievances, for persons who complain not, or to infuse a spirit of freedom and independence, in a climate where nature possibly never intended they should flourish, and which, if obtained, would apparently be attended with effects, that all their advantages would badly compensate.

In Pussummah, which nearly borders upon Rejang, to the southward, there appears some difference in the mode of government, though the same spirit pervades both; the chiefs being equally without a regular coercive power, and the people equally free in the choice of whom they will
SUMATRA.

will serve. This is an extensive, and, comparatively, populous country, bounded on the north by that of Lamattang, and on the south-east by that of Lampong; the river of Padang-guchi marking the division from the latter, near the sea-coast. It is distinguished into Passummah lebbar, or the broad, which lies inland, extending to within a day's journey of Muaro Mulang, on Palembang River; and Passummah ulu Manna, which is on the western side of the range of hills, whither the inhabitants are said to have mostly removed, in order to avoid the government of Palembang.

It is governed by four pangerans, who are independent of each other, but acknowledge a kind of sovereignty in the sultan of Palembang, from whom they hold a chap (warrant) and receive a salin (investiture); on their accession. This subordination is the consequence of the king of Bantam's former influence over this part of the island, Palembang being a port anciently dependant on him, and now on the Dutch, whose instrument the sultan is. There is an inferior pangeran in almost every dusun (that title being nearly as common in Passummah, as dupati towards the sea-coast) who are chosen by the inhabitants, and confirmed by the superior pangeran, whom they assist in the determination of causes. In the low country, where the pepper-planters reside, the title of kalippah prevails; which is a corruption of the Arabic word khalifah, signifying a vicegerent. Each of these presides over various tribes, which have been collected at different times (some of them being colonists from Rejang, as well as from a country to the eastward of them, named Haji) and have ranged themselves, some under one, and some under another chief; having also their superior proatfin, or pambarab, as in the northern districts. On the rivers of Peeno, Manna, and Bankannon, are two kalippahs respectively, some of whom are also pangerans, which last seems to be here rather a title of honour, or family distinction, than of magistracy. They are independent of each other, owning no superior; and their number, according to the ideas of the people, cannot be increased.
There is no word in the languages of the island which properly and strictly signifies law; nor is there any person or class of persons among the Rejans regularly invested with a legislative power. They are governed in their various disputes, by a set of long-established customs (adat), handed down to them from their ancestors, the authority of which is founded on usage and general consent. The chiefs, in pronouncing their decisions, are not heard to say, "so the law directs," but "such is the custom." It is true, that if any case arises, for which there is no precedent on record (of memory), they deliberate and agree on some mode, that shall serve as a rule in future similar circumstances. If the affair be trifling, that is seldom objected to; but when it is a matter of consequence, the paingeran, or kalippah, (in places where such are present) consults with the proattins, or lower order of chiefs, who frequently desire time to consider of it, and consult with the inhabitants of their dusun. When the point is thus determined, the people voluntarily submit to observe it as an established custom; but they do not acknowledge a right in the chiefs, to constitute what laws they think proper, or to repeal or alter their ancient usages, of which they are extremely tenacious and jealous. It is, notwithstanding, true, that by the influence of the Europeans, they have at times been prevailed on, to submit to innovations in their customs; but, except when they perceived a manifest advantage from the change, they have generally seized an opportunity of reverting to the old practice.

All causes, both civil and criminal, are determined by the several chiefs of the district, assembled together, at stated times, for the purpose of distributing justice. These meetings are called becharo, (which signifies also to discourse or debate) and among us, by an easy corruption, bechars. Their manner of settling litigations, in points of property, is
rather a species of arbitration, each party previously binding himself to submit to the award, than the exertion of a coercive power, possessed by the court, for the redress of wrongs.

The want of a written criterion of the laws, and the imperfect stability of traditionary usage, must frequently, in the intricacies of their suits, give rise to contradictory decisions; particularly as the interests and passions of the chiefs are but too often concerned in the determination of the causes that come before them. This evil had long been perceived by the English Residents, who, in the countries where we are settled, preside at the bechars, and being instigated by the splendid example of the Governor-general of Bengal (Mr. Hastings), under whose direction a code of the laws of that empire was compiled (and translated by Mr. Halhed), it was resolved, that the servants of the Company at each of the subordinates, should, with the assistance of the ablest and most experienced of the natives, attempt to reduce to writing, and form a system of the usages of the Sumatrans, in their respective residencies. This was accordingly executed in some instances, and a translation of that compiled in the residency of Laye coming into my possession, I insert it here, in the original form, as being attended with more authority and precision, than any account furnished from my own memorandums could pretend to.

"REJANG LAWS."

"For the more regular and impartial administration of justice in the Residency of Laye, the laws and customs of the Rejangs, hitherto preserved by tradition, are now, after being discussed, amended, and ratified, in an assembly of the panigeran, pambarabs, and proattins, committed to writing, in order that they may not be liable to alteration; that those deserving death or fine may meet their reward; that causes may be brought before the proper judges, and due amends made for defaults; that the compensation for murder may be fully paid; that property may be equitably divided; that what is borrowed may be restored; that gifts may become the undoubted property of the receiver; that debts may be paid, and credits received, agreeably to the customs that have
have been ever in force, beneath the heavens and on the face of the earth. By the observance of the laws, a country is made to flourish, and where they are neglected or violated, ruin ensues.

"BECHARS, SUITS, OR TRIALS.

"The plaintiff and defendant first state to the bench the general circumstances of the case. If their accounts differ, and they consent to refer the matter to the decision of the proatlins or bench, each party is to give a token, to the value of a suku, that he will abide by it, and to find security for the chogo, a sum stated to them, supposed to exceed the utmost probable damages.

DOLLARS. DOLLARS.

"If the chogo do not exceed 30 the bio or fee paid by each is 1½
Ditto 30 to 50 ditto 2½
Ditto 50 to 100 ditto 5
Ditto 100 and upwards ditto 9

"All chiefs of dusuns, or independent tallangs, are entitled to a seat on the bench upon trials.

"If the pañgeran sits at the bechar, he is entitled to one half of all bio, and of such fines, or shares of fines, as fall to the chiefs, the pambarabs and other proatlins dividing the remainder.

"If the pañgeran be not present, the pambarabs have one-third, and the other proatlins two-thirds of the foregoing. Though a single pambarab only sit, he is equally entitled to the above one-third. Of the other proatlins, five are requisite to make a quorum.

"No bechar, the chogo of which exceeds five dollars, to be held by the proatlins, except in the presence of the Company’s Resident, or his assistant.

"If a person maliciously brings a false accusation, and it is proved such, he is liable to pay a sum equal to that which the defendant would have incurred, had his design succeeded; which sum is to be divided between the defendant and the proatlins, half and half.

"The fine for bearing false witness, is twenty dollars and a buffalo.

"The punishment of perjury is left to the superior powers (orang alus). Evidence here is not delivered on previous oath.
SUMATRA.

“INHERITANCE.

Laws of inheritance. “ If the father leaves a will, or declares before witnesses his intentions relative to his effects or estate, his pleasure is to be followed in the distribution of them amongst his children.

“ If he dies intestate, and without declaring his intentions, the male children inherit, share and share alike, except that the house and pusako (heirlooms, or effects on which, from various causes, superstitious value is placed) devolve invariably to the eldest.

“ The mother (if by the mode of marriage termed jujur, which, with the other legal terms, will be hereafter explained) and the daughters are dependant on the sons.

“ If a man, married by semando, dies, leaving children, the effects remain to the wife and children. If the woman dies, the effects remain to the husband and children. If either dies, leaving no children, the family of the deceased is entitled to half the effects.

“OUTLAWRY.

Of outlawry. “ Any person unwilling to be answerable for the debts or actions of his son, or other relation under his charge, may outlaw him, by which he, from that period, relinquishes all family connexion with him, and is no longer responsible for his conduct.

“ The outlaw to be delivered up to the Resident or pañgeran, accompanied with his writ of outlawry, in duplicate, one copy to be lodged with the Resident, and one with the outlaw’s pambarab.

“ The person who outlaws must pay all debts to that day.

“ On amendment, the outlaw may be recalled to his family, they paying such debts as he may have contracted whilst outlawed, and redeeming his writ by payment of ten dollars and a goat, to be divided among the pañgeran and pambarabs.

“ If an outlaw commits murder, he is to suffer death.

“ If murdered, a baṅgun, or compensation, of fifty dollars, is to be paid for him to the pañgeran.

“ If an outlaw wounds a person, he becomes a slave to the Company or pañgeran for three years. If he absconds, and is afterwards killed, no baṅgun is to be paid for him.

“ If
"If an outlaw wounds a person, and is killed in the scuffle, no bangun is to be paid for him.

"If the relations harbour an outlaw, they are held willing to redeem him, and become answerable for his debts.

"THEFT.

"A person convicted of theft, pays double the value of the goods stolen, with a fine of twenty dollars and a buffalo, if they exceed the value of five dollars: if under five dollars, the fine is five dollars and a goat; the value of the goods still doubled.

"All thefts under five dollars, and all disputes for property, or offences to that amount, may be compromised by the proattins whose dependants are concerned.

"Neither assertion, nor oath of the prosecutor, are sufficient for conviction, without token (chino) of the robbery, viz. some article recovered of the goods stolen; or evidence sufficient.

"If any person, having permission to pass the night in the house of another, shall leave it before day-break, without giving notice to the family, he shall be held accountable for any thing that may be that night missing.

"If a person passing the night in the house of another, does not commit his effects to the charge of the owner of it, the latter is not accountable, if they are stolen during the night. If he has given them in charge, and the stranger's effects only are lost during the night, the owner of the house becomes accountable. If effects both of the owner and lodger are stolen, each is to make oath to the other that he is not concerned in the robbery, and the parties put up with their loss, or retrieve it as they can.

"Oaths are usually made on the korān, or at the grave of an ancestor, according as the Mahometan religion prevails more or less. The party intended to be satisfied by the oath, generally prescribes the mode and purport of it.

"BANGUN."
The *bangun*, or compensation for the murder of a *pambarab*, is 500 dollars.

Ditto of an inferior *proattin* 250 dollars.

Ditto of a common person—man or boy 80 dollars.

Ditto ditto woman or girl 150 dollars.

Ditto of the legitimate children or wife of a *pambarab* 250 dollars.

Exclusive of the above, a fine of fifty dollars and a buffalo, as *tippong bumi* (expiation), is to be paid on the murder of a *pambarab*; of twenty dollars and a buffalo, on the murder of any other; which goes to the *pambarab* and *proatlins*.

The *bangun* of an outlaw is fifty dollars, without *tippong bumi*.

No *bangun* is to be paid for a person killed in the commission of a robbery.

The *bangun* of *pambarabs* and *proatlins* is to be divided between the *pañgeran* and *pambarabs*, one half; and the family of the deceased, the other half.

The *bangun* of private persons is to be paid to their families; deducting the *adat ulasan* of ten per cent. to the *pambarabs* and *proatlins*.

If a man kills his slave, he pays half his price, as *bangun*, to the *pañgeran*, and the *tippong bumi* to the *proatlins*.

If a man kills his wife by *jujur*, he pays her *bangun* to her family, or to the *proatlins*, according as the *tali kulo* subsists or not.

If a man kills or wounds his wife by *semando*, he pays the same as for a stranger.

If a man wounds his wife by *jujur*, slightly, he pays one *tail* or two dollars.

If a man wounds his wife by *jujur*, with a weapon, and an apparent intention of killing her, he pays a fine of twenty dollars.

If the *tali kulo* (tie of relationship) is broken, the wife's family can no longer claim *bangun* or fine: they revert to the *proatlins*.

If a *pambarab* wounds his wife by *jujur*, he pays five dollars and a goat.

If a *pambarab*'s daughter, married by *jujur*, is wounded by her husband, he pays five dollars and a goat.

"For
SUMATRA.

"For a wound occasioning the loss of an eye or limb, or imminent danger of death, half the baṅgun is to be paid.

"For a wound on the head, the pampas, or compensation, is twenty dollars.

"For other wounds, the pampas from twenty dollars downwards.

"If a person is carried off and sold beyond the hills, the offender, if convicted, must pay the baṅgun. If the person has been recovered previous to the trial, the offender pays half the baṅgun.

"If a man kills his brother, he pays to the proattins the tippong bumi.

"If a wife kills her husband, she must suffer death.

"If a wife by semando wounds her husband, her relations must pay what they would receive if he wounded her.

"DEBS AND CREDITS.

"On the death of a person in debt (unless he die an outlaw, or married by ambel-anak) his nearest relation becomes accountable to the creditors.

"Of a person married by ambel-anak, the family he married into is answerable for debts contracted during the marriage: such as were previous to it, his relations must pay.

"A father, or head of a family, has hitherto been in all cases liable to the debts of his sons, or younger relations under his care; but to prevent as much as possible his suffering by their extravagance, it is now resolved—

"That if a young, unmarried man (bujang) borrows money, or purchases goods without the concurrence of his father, or of the head of his family, the parent shall not be answerable for the debt. Should the son use his father’s name in borrowing, it shall be at the lender’s risk, if the father disavows it.

"If any person gives credit to the debtor of another (publicly known as such, either in the state of meṅgiring, when the whole of his labour belongs to the creditor, or of be-blah, when it is divided) the latter creditor can neither disturb the debtor for the sum, nor oblige the former to pay it. He must either pay the first debt (membulati, consolidate),
solidate), or let his claim lie over till the debtor finds means to discharge it.

“Interest of money has hitherto been three fanams per dollar per month, or one hundred and fifty per cent. per annum. It is now reduced to one fanam, or fifty per cent. per annum, and no person is to receive more, under penalty of fine, according to the circumstances of the case.

“No more than double the principal can in any case be recovered at law. A person lending money at interest, and letting it lie over beyond two years, loses the surplus.

“No pepper planter to be taken as a debtor mengiring, under penalty of forty dollars.

“A planter in debt may engage in any work for hire that does not interfere with the care of his garden, but must on no account mengiring, even though his creditor offers to become answerable for the care of his garden.

“If a debtor mengiring absconds from his master (or creditor, who has a right to his personal service) without leave of absence, he is liable to an increase of debt, at the rate of three fanams per day. Females have been hitherto charged six fanams, but are now put upon a footing the same as the men.

“If a debtor mengiring, without security, runs away, his debt is liable to be doubled if he is absent above a week.

“If a man takes a person mengiring, without security for the debt, should the debtor die in that predicament, the creditor loses his money, having no claim on the relations for it.

“If a person takes up money, under promise of mengiring at a certain period, should he not perform his agreement, he must pay interest for the money, at one fanam per dollar per month.

“If a person, security for another, is obliged to pay the debt, he is entitled to demand double from the debtor; but this claim to be moderated according to circumstances.

“If a person sues for a debt which is denied, the onus probandi lies with the plaintiff. If he fails in proof, the defendant, on making oath to the justness of his denial, shall be acquitted.

“If
"If a debtor taking care of a pepper garden, or one that gives half produce to his creditor (be-blah), neglects it, the person in whose debt he is, must hire a man to do the necessary work; and the hire so paid shall be added to the debt. Previous notice shall, however, be given to the debtor, that he may, if he pleases, avoid the payment of the hire, by doing the work himself.

"If a person's slave, or debtor mengiring, be carried off, and sold beyond the hills, the offender is liable to the baṅgun, if a debtor, or to his price, if a slave. Should the person be recovered, the offender is liable to a fine of forty dollars, of which the person that recovers him has half, and the owner or creditor, the remainder. If the offender be not secured, the reward shall be only five dollars to the person that brings the slave, and three dollars the debtor, if on this side the hills; if from beyond the hills, the reward is doubled.

"MARRIAGE.

"The modes of marriage prevailing hitherto, have been principally by jujur, or by ambel-anak; the Malay semando being little used. The obvious ill consequences of the two former, from the debt or slavery they entailed upon the man that married, and the endless lawsuits they gave rise to, have at length induced the chiefs to concur in their being, as far as possible, laid aside; adopting in lieu of them, the semando malayo, or mardiko; which they now strongly recommend to their dependants, as free from the incumbrances of the other modes, and tending, by facilitating marriage, and the consequent increase of population, to promote the welfare of their country. Unwilling, however, to abolish arbitrarily a favourite custom of their ancestors, marriage by jujur is still permitted to take place, but under such restrictions as will, it is hoped, effectually counteract its hitherto pernicious consequences. Marriage by ambel-anak, which rendered a man and his descendants the property of the family he married into, is now prohibited, and none permitted for the future, but by semando, or jujur, subject to the following regulations.

"The jujur of a virgin (gadis) has been hitherto one hundred and twenty
twenty dollars: the adat annexed to it, have been tulis tarîggil, fifteen dollars; upah dawn kodo, six dollars, and tali kulo, five dollars:

"The jujur of a widow, eighty dollars, without the adat; unless her children by the former marriage went with her, in which case the jujur gadis was paid in full.

"It is now determined, that on a man's giving his daughter in marriage, by jujur, for the future, there shall, in lieu of the above, be fixed a sum not exceeding one hundred and fifty dollars, to be in full for jujur and all adat whatever. That this sum shall, when the marriage takes place, be paid upon the spot; that if credit is given for the whole, or any part, it shall not be recoverable by course of law; and as the sum includes the tali kulo, or bond of relationship, the wife thereby becomes the absolute property of the husband. The marriage by jujur being thus rendered equivalent to actual sale, and the difficulty enhanced by the necessity of paying the full price upon the spot, it is probable, that the custom will in a great measure cease, and though not positively, be virtually abolished. Nor can a lawsuit follow from any future jujur.

"The adat, or custom, of the semando malayor or mardîko, to be paid by the husband to the wife's family upon the marriage taking place, is fixed at twenty dollars and a buffalo, for such as can afford it; and at ten dollars and a goat, for the poorer class of people.

"Whatever may be acquired by either party during the subsistence of the marriage, becomes joint property, and they are jointly liable to debts incurred, if by mutual consent. Should either contract debts without the knowledge and consent of the other, the party that contracts, must alone bear them, in case of a divorce.

"If either party insists upon, or both agree in it, a divorce must follow. No other power can separate them. The effects, debts, and credits, in all cases to be equally divided. If the man insists upon the divorce, he pays a charo of twenty dollars to the wife's family, if he obtained her a virgin; if a widow, ten dollars. If the woman insists on the divorce, no charo is to be paid. If both agree in it, the man pays half the charo.

"If a man married by semando dies—Vide "Inheritance."

"If
"If a man carries off a woman with her consent, and is willing either to pay her price at once by *jujur*, or marry her by *semando*, as the father or relations please, they cannot reclaim the woman, and the marriage takes place.

"If a man carries off a girl under age, (which is determined by her not having her ears bored, and teeth filed—*bulum bertindé berdabong*) though with her own consent, he pays, exclusive of the *adat jujur*, or *semando*, twenty dollars, if she be the daughter of a *pambarab*; and ten dollars for the daughter of any other, whether the marriage takes place or not.

"If a *visau*, or person without property and character, carries off a woman (though with her own consent) and can neither pay the *jujur*, nor *adat semando*, the marriage shall not take place, but the man be fined five dollars and a goat for misdemeanour. If she be under age, his fine ten dollars and a goat.

"If a man has but one daughter, whom, to keep her near him, he wishes to give in marriage by *semando*; should a man carry her off, he shall not be allowed to keep her by *jujur*, though he offer the money upon the spot. If he refuses to marry her by *semando*, no marriage takes place, and he incurs a fine to the father of ten dollars and a goat.

"If a man carries off a woman under pretence of marriage, he must lodge her immediately with some reputable family. If he carries her elsewhere, for a single night, he incurs a fine of fifty dollars, payable to her parents or relations.

"If a man carries off a virgin against her inclination (*me-ulih*) he incurs a fine of twenty dollars and a buffalo: if a widow, ten dollars and a goat, and the marriage does not take place. If he commits a rape, and the parents do not chuse to give her to him in marriage, he incurs a fine of fifty dollars.

"The *adat libei*, or custom of giving one woman in exchange for another taken in marriage, being a modification of the *jujur*, is still admitted of; but if the one be not deemed an equivalent for the other, the necessary compensation (as the *pangalappang*, for nonage) must be paid upon the spot, or it is not recoverable by course of law. If a virgin is carried off (*te-lari gadis*) and another is given in exchange for her,
her, by adat libei, twelve dollars must be paid with the latter, as adat ka-salah.

“A man married by ambel-anak, may redeem himself and family, on payment of the jujur and adat of a virgin before-mentioned.

“The charo of a jujur marriage is twenty-five dollars. If the jujur be not yet paid in full, and the man insists on a divorce, he receives back what he has paid, less twenty-five dollars. If the woman insists, no charo can be claimed by her relations. If the tali kulo is putus (broken) the wife is the husband’s property, and he may sell her if he pleases.

“An unmarried woman proves with child, the man against whom the fact is proved, must marry her; and they pay to the proattins a joint fine of twenty dollars and a buffalo. This fine, if the parties agree to it, may be levied in the country by the neighbouring proattins (without bringing it before the regular court).

If a woman proves with child by a relation within the prohibited degrees, they pay to the proattins a joint fine of twice fifty dollars, and two buffaloes (hukum duo akup).

“A marriage must not take place between relations, within the third degree, or tuğal nêne. But there are exceptions for the descendants of females, who passing into other families become as strangers. Of two brothers, the children may not intermarry. A sister’s son may marry a brother’s daughter; but a brother’s son may not marry a sister’s daughter.

“On the death of a man married by jujur or purchase, any of his brothers, the eldest in preference, if he pleases, may succeed to his bed.
bed. If no brother chases it, they may give the woman in marriage to any relation on the father's side, without adat; the person who marries her replacing the deceased (maṅgabalù). If no relation takes her, and she is given in marriage to a stranger, he may be either adopted into the family, to replace the deceased, without adat, or he may pay her jujur, or take her by semando, as her relations please.

"If a person lies with a man's wife, by force, he is deserving of death; but may redeem his head by payment of the baṅgun, eighty dollars, to be divided between the husband and proattins.

"If a man surprises his wife in the act of adultery, he may put both man and woman to death upon the spot, without being liable to any baṅgun. If he kills the man and spares his wife, he must redeem her life, by payment of fifty dollars to the proattins. If the husband spares the offender, or has only information of the fact from other persons, he may not afterwards kill him, but has his remedy at law, the fine for adultery being fifty dollars, to be divided between the husband and the proattins. If he divorces his wife on this account, he pays no charo.

"If a younger sister be first married, the husband pays six dollars, adat pelalu, for passing over the elder.

"GAMING.

"All gaming, except cock-fighting at stated periods, is absolutely pro-hibited. The fine for each offence is fifty dollars. The person in whose house it is carried on, if with his knowledge, is equally liable to the fine with the gamesters. A proattin knowing of gaming in his dusun, and concealing it, incurs a fine of twenty dollars. One half of the fines goes to the informer; the other to the Company, to be distributed among the industrious planters, at the yearly payment of the customs.

"OPIUM FARM.

"The fine for the retailing of opium by any other than the person who farms
farms the license, is fifty dollars for each offence: one half to the farmer, and the other to the informer.

"The executive power for enforcing obedience to these laws and customs, and for preserving the peace of the country, is, with the concurrence of the panägan and proattins, vested in the Company's Resident.

"Done at Laye, in the month Rabia-al akhir, in the year of the Hejra 1193, answering to April 1779.

"JOHN MARSDEN, Resident."

"Laws or Adat of Manna."

Having procured likewise a copy of the regulations sanctioned by the chiefs of the Passummah country assembled at Manna, I do not hesitate to insert it, not only as varying in many circumstances from the preceding, but because it may eventually prove useful to record the document.

"INHERITANCE."

"If a person dies, having children, these inherit his effects in equal portions, and become answerable for the debts of the deceased. If any of his brothers survive, they may be permitted to share with their nephews, but rather as matter of courtesy than of right, and only when the effects of the deceased devolved to him from his father or grandfather. If he was a man of rank, it is common for the son who succeeds him in title to have a larger share. This succession is not confined to the eldest born, but depends much on private agreement in the family. If the deceased person leaves no kindred behind him, the tribe to which he belonged shall inherit his effects, and be answerable for his debts.

"DEBTS."

"When a debt becomes due, and the debtor is unable to pay his creditors,
S U M A T R A.

231

ditors, or has no effects to deposit, he shall himself, or his wife, or his children, live with the creditor as a bond-slave or slaves, until redeemed by the payment of the debt.

" If a debt is contracted without any promise of interest, none shall be demanded, although the debt be not paid until some time after it first became due. The rate of interest is settled at twenty per cent. per annum; but in all suits relating to debts on interest, how long soever they may have been outstanding, the creditor shall not be entitled to more interest than may amount to a sum equal to the capital: if the debt is recent, it shall be calculated as above. If any person lends to another a sum exceeding twenty-five dollars, and sues for payment before the chiefs, he shall be entitled only to one year's interest on the sum lent. If money is lent to the owner of a padi-plantation, on an agreement to pay interest in grain, and after the harvest is over the borrower omits to pay the stipulated quantity, the lender shall be entitled to receive at the rate of fifteen dollars for ten lent; and if the omission should be repeated another season, the lender shall be entitled to receive double the principal. In all cases of debt contested, the onus probandi lies with the demandant, who must make good his claim by creditable evidence, or in default thereof, the respondent may by oath clear himself from the debt. On the other hand, if the respondent allows such a debt to have existed, but asserts a previous payment, it rests with him to prove such payment by proper evidence, or in defect, the demandant shall by oath establish his debt.

" EVIDENCE AND OATHS.

" In order to be deemed a competent and unexceptionable evidence, a person must be of a different family and dusun from the person in whose behalf he gives evidence, of good character, and a free man: but if the dispute be between two inhabitants of the same dusun, persons of such dusun are allowed to be complete evidence. In respect to the oath taken by the principals in a dispute, the hukuman (or comprehensive quality of the oath) depends on the nature of the property in dispute: if it relates to the effects of the grandfather, the hukuman must extend to the descendants from the grandfather; if it relates to the effects
effects of the father, it extends to the descendants of the father, &c. If any of the parties proposed to be included in the operation of the oath refuse to subject themselves to the oath, the principal in the suit loses his cause.

"PAWNS OR PLEDGES.

If any person holding a pawn or pledge, such as wearing-apparel, household effects, or krises, swords, or kujur (lances), shall pledge it for a larger sum than he advanced for it, he shall be answerable to the owner for the full value of it, on payment of the sum originally advanced. If any person holding as a pledge, man, woman, or child, shall pledge them to any other at an advanced sum, or without the knowledge of the owner, and by these means the person pledged should be sold as a slave, he shall make good to the owner the full value of such slave, and pay a fine of twenty-eight dollars. If any person whatever, holding man, woman, or child, as a pawn, either with janji-lalu (term expired) or not, or with or without the consent of the original owner, shall sell such person as a slave without the knowledge of the Resident and Chiefs, he shall be fined twenty-eight dollars.

"BUFFALOES.

All persons who keep buffaloes shall register at the godong (factory-house) their tinīgas or mark; and, in case any dispute shall arise about a marked buffalo, no person shall be allowed to plead a mark that is not registered. If any wild (stray) buffalo or buffaloes, unmarked, shall be taken in a kandang (staked inclosure) they shall be adjudged the property of any who takes upon himself to swear to them; and if it should happen that two or more persons insist upon swearing to the same buffaloes, they shall be divided among them equally. If no individual will swear to the property, the buffaloes are to be considered as belonging to the kalippah or magistrate of the district where they were caught. The person who takes any buffaloes in his kandang shall be entitled to a gratuity of two dollars per head. If any buffaloes get into a pepper-garden, either by day or night, the owner
of the garden shall have liberty to kill them, without being answerable to the owner of the buffaloes: yet, if it shall appear on examination that the garden was not properly fenced, and from this defect suffers damage, the owner shall be liable to such fine as the Resident and Chiefs shall judge it proper to impose.

"THEFT.

"A person convicted of stealing money, wearing-apparel, household effects, arms, or the like, shall pay the owner double the value of the goods stolen, and be fined twenty-eight dollars. A person convicted of stealing slaves, shall pay to the owner at the rate of eighty dollars per head, which is estimated to be double the value, and fined twenty-eight dollars. A person convicted of stealing betel, fowls, or coconuts, shall pay the owner double the value, and be fined seven dollars; half of which fine is to be received by the owner. If buffaloes are stolen, they shall be valued at twelve dollars per head: padi at four bakul (baskets) for the dollar. If the stolen goods be found in the possession of a person who is not able to account satisfactorily how he came by them, he shall be deemed the guilty person. If a person attempting to seize a man in the act of thieving, shall get hold of any part of his clothes which are known, or his kris or sivah, this shall be deemed a sufficient token of the theft. If two witnesses can be found who saw the stolen goods in possession of a third person, such person shall be deemed guilty, unless he can account satisfactorily how he became possessed of the goods. The oath taken by such witnesses shall either include the descendants of their father, or simply their own descendants, according to the discretion of the chiefs who sit as judges. If several people sleep in one house, and one of them leaves the house in the night without giving notice to any of the rest, and a robbery be committed in the house that night, the person so leaving the house shall be deemed guilty of the crime, provided the owner of the stolen goods be willing to subject himself to an oath on the occasion; and provided the other persons sleeping in the house shall clear themselves by oath from being concerned in the theft: but if it should happen that a person so convicted, being really innocent, should in after time
discover the person actually guilty, he shall have liberty to bring his suit and recover. If several persons are sleeping in a house, and a robbery is committed that night, although none leave the house, the whole shall be obliged to make oath that they had no knowledge of, or concern in, the theft, or on refusal shall be deemed guilty. In all cases of theft where only a part of the stolen goods is found, the owner must ascertain upon oath the whole amount of his loss.

"MURDER, WOUNDING, AND ASSAULT.

Murder. "A person convicted of murder shall pay to the relations of the deceased a baṅgun of eighty-eight dollars, one suku, and seventy-five cash; to the chiefs a fine of twenty-eight dollars; the bhasa lurah, which is a buffalo and one hundred bamboos of rice; and the palantan, which is fourteen dollars. If a son kills his father, or a father his son, or a man kills his brother, he shall pay a fine of twenty-eight dollars, and the bhasa lurah as above. If a man kills his wife, the relations of the deceased shall receive half a baṅgun: if any other kills a man's wife, the husband is entitled to the baṅgun, but shall pay out of it, to the relations of the wife, ten dollars. In wounds a distinction is made in the parts of the body. A wound in any part from the hips upward, is esteemed more considerable than in the lower parts. If a person wounds another with sword, kris, kujur, or other weapon, and the wound is considerable, so as to maim him, he shall pay to the person wounded a half-baṅgun, and to the chiefs, half of the fine for murder, with half of the bhasa lurah, &c. If the wound is trifling, but fetches blood, he shall pay the person wounded the tepong of fourteen dollars, and be fined fourteen dollars. If a person wounds another with a stick, bamboo, &c. he shall simply pay the tepong of fourteen dollars. If in any dispute between two people krises are drawn, the person who first drew his kris shall be fined fourteen dollars. If any person having a dispute assembles together his friends with arms, he shall be fined twenty-eight dollars.

"MARRIAGE;
"MARRIAGE, DIVORCE, &c.

There are two modes of marriage used here: one by purchase, called *Marriage, jujur* or *kulu*, the other by adoption, called *ambel anak*. First of *jujur*.

When a person is desirous of marrying, he deposits a sum of money *jujur* in the hands of the father of the virgin, which is called the *pagatan*. This sum is not esteemed part of the purchase, but as an equivalent for the *dandānan* (paraphernalia, or ornamental apparel) of the bride, and is not fixed, but varies according to the circumstances and rank of the father. The amount of the *jujur* is fixed at seventy dollars, including the *hurup niawa* (price of life), forty dollars, a *kris* with gold about the head and silver about the sheath, valued at ten dollars, and the *meniudakan billi* or *putus kulo* (completion of purchase) at twenty. If a young man runs away with a *gadis* or virgin, without the consent of the father, he does not act contrary to the laws of the country; but if he refuses to pay the full *jujur* on demand, he shall be fined twenty-eight dollars. If the father, having received the *pagatan* of one man, marries his daughter to another before he returns the money to the first, he shall be fined fourteen dollars, and the man who marries the daughter shall also be fined fourteen dollars. In case of divorce (which may take place at the will of either party) the *dandānan* brought by the wife is to be valued and to be deducted from the purchase-money. If a divorce originates from the man, and before the whole purchase-money is paid, the man shall receive back what he has advanced, after deducting the *dandānan* as above, and fourteen dollars, called *penusutan*. If the divorce originates with the woman, the whole purchase-money shall be returned, and the children, if any, remain with the father. If a divorce originates with the man, when the whole purchase-money has been paid, or *kulo sudah putus*, he shall not be entitled to receive back the purchase-money, but may recal his wife whenever it shall be agreeable to him. An exact estimation is made of the value of the woman's ornaments, and what are not restored with her, must be made good by the husband. If there are children, they are in this case to be divided, or if there be only one, the husband is

2 H 2
Ambel anak. "When a man marries after the custom, called ambel anak, he pays no money to the father of the bride, but becomes one of his family, and is entirely upon the footing of a son; the father of his wife being thenceforward answerable for his debts, &c. in the same manner as for his own children. The married man becomes entirely separate from his original family, and gives up his right of inheritance. It is, however, in the power of the father of the wife to divorce from her his adopted son whenever he thinks proper, in which case the husband is not entitled to any of the children, nor to any effects other than simply the clothes on his back; but if the wife is willing still to live with him, and he is able to redeem her and the children by paying the father an hundred dollars, it is not at the option of the father to refuse accepting this sum; and in that case the marriage becomes a kulo or jujur, and is subject to the same rules. If any unmarried woman is convicted of incontinence, or a married woman of adultery, they shall pay to the chiefs a fine of forty dollars, or in defect thereof, become slaves, and the man with whom the crime was committed shall pay a fine of thirty dollars, or in like manner become a slave; and the parties between them shall also be at the expence of a buffalo and an hundred bamboos of rice. This is called the gawe pati or panjičan. If an unmarried woman proves with child, and refuses to name the man with whom she was guilty, she shall pay the whole fine of seventy dollars, and furnish the buffalo, &c. If a woman after marriage brings forth a child before the due course of nature, she shall be fined twenty-eight dollars. If a man keeps a young woman in his house for any length of time, and has a child by her without being regularly married, he shall be fined twenty-eight dollars, and furnish a buffalo and an hundred bamboos of rice. If a person detects the offenders in the act of adultery, and attempting to seize the man, is obliged to kill him in self-defence, he shall not pay the baŋgun, nor be fined, but only pay the bhasa lurah, which is a buffalo and an hundred bamboos of rice. On the other hand, if the guilty person kills the one who attempts to seize him, he shall be deemed guilty of murder, and pay the baŋgun and fine accordingly. If a man holding
a woman as a pawn, or in the condition of mẽ̩giring shall commit fornication with her, he shall forfeit his claim to the debt, and the woman become free.

"OUTLAWRY.

"If the members of a family have suffered inconvenience from the ill conduct of any of their relations, by having been rendered answerable for their debts, &c. it shall be in their power to clear themselves from all future responsibility on his account by paying to the chiefs the sum of thirty dollars, a buffalo, and an hundred bamboos of rice. This is termed buang surat. Should the person so cast out be afterwards murdered, the relations have forfeited their right to the bã̩gun, which devolves to the chiefs.

"Dated at Manna, July 1807.

"JOHN CRISP, Resident."
Remarks on the foregoing system of the *adat*, or customs of the country, being digested chiefly for the use of the natives, or of persons well acquainted with their manners in general, and being designed, not for an illustration of the customs, but simply as a standard of right, the fewest and concisest terms possible have been made use of, and many parts must necessarily be obscure to the bulk of readers. I shall, therefore, revert to those particulars that may require explanation, and endeavour to throw a light upon the spirit and operation of such of their laws especially, as seem most to clash with our ideas of distributive justice. This comment is the more requisite, as it appears that some of their regulations, which were judged to be inconsistent with the prosperity of the people, were altered and amended, through the more enlightened reason of the persons who acted as the representatives of the English company; and it may be proper to recal the idea of the original institutions.

The plaintiff and defendant usually plead their own cause, but if circumstances render them unequal to it, they are allowed to *pinjam mulut*, (borrow a mouth). Their advocate may be a *proatfin*, or other person indifferently; nor is there any stated compensation for the assistance, though, if the cause be gained, a gratuity is generally given, and too apt to be rapaciously exacted by these chiefs from their clients, when their conduct is not attentively watched. The *proatfin* also, who is security for the damages, receives privately some consideration; but none is openly allowed of. A refusal on his part to become security for his dependant or client, is held to justify the latter in renouncing his civil dependance, and chusing another patron.

Evidence
Evidence is used among these people in a manner very different from the forms of our courts of justice. They rarely admit it on both sides of the question; nor does the witness first make a general oath to speak the truth, and nothing but the truth. When a fact is to be established, either on the part of the plaintiff, or of the defendant, he is asked if he can produce any evidence to the truth of what he asserts. On answering in the affirmative, he is directed to mention the person. This witness must not be a relation, a party concerned, nor even belong to the same dusun. He must be a responsible man, having a family, and a determinate place of residence. Thus qualified, his evidence may be admitted. They have a settled rule in respect to the party that is to produce evidence. For instance; A. sues B. for a debt: B. denies the debt: A. is now to bring evidence to the debt, or, on failure thereof, it remains with B. to clear himself of the debt, by swearing himself not indebted. Had B. acknowledged that such a debt had formerly subsisted, but was since paid, it would be incumbent on B. to prove the payment by evidence, or on failure it would rest with A. to confirm the debt’s being still due, by his oath. This is an invariable mode, observed in all cases of property.

As their manner of giving evidence differs from ours, so also does the nature of an oath among them differ from our idea of it. In many cases it is requisite that they should swear to what it is not possible in the nature of things they should know to be true. A. sues B. for a debt due from the father or grandfather of B. to the father or grandfather of A. The original parties are dead, and no witness of the transaction survives. How is the matter to be decided? It remains with B. to make oath, that his father or grandfather never was indebted to those of A.; or that if he was indebted, the debt had been paid. This, among us, would be esteemed a very strange method of deciding causes; but among these people, something of the kind is absolutely necessary. As they have no sort of written accounts, nor any thing like records or registers among them, it would be utterly impossible for the plaintiff to establish the debt, by a positive proof, in a multitude of cases; and were the suit to be dismissed at once, as with us, for want of such proof, numbers of innocent persons would lose the debts really due to them, through
the knavery of the persons indebted, who would scarce ever fail to deny a debt. On the side of the defendant again; if he was not permitted to clear himself of the debt by oath, but that it rested with the plaintiff only, to establish the fact by a single oath, there would be a set of unprincipled fellows daily swearing debts against persons who never were indebted to any of their generation. In such suits, and there are many of them, it requires no small discernment to discover, by the attendant circumstances, where the truth lies; but this may be done, in most instances, by a person who is used to their manners, and has a personal knowledge of the parties concerned. But what they mean by their oath, in those cases, where it is impossible they should be acquainted with the facts they design to prove, is no more than this; that they are so convinced of the truth of the matter, as to be willing to subject themselves to the paju sumpah (destructive consequences of perjury) if what they assert is believed by them to be false. The form of words used is nearly as follows: "If what I now declare, namely" (here the fact is recited) "is truly and really so, may I be freed and clear from my oath: if what I assert is wittingly false, may my oath be the cause of my destruction." But it may be easily supposed, that where the punishment for a false oath rests altogether with the invisible powers, where no direct infamy, no corporal punishment is annexed to the perjury, there cannot fail to be many, who would makan sumpah (swallow an oath), and willingly incur the guilt, in order to acquire a little of their neighbour’s property.

Although an oath, as being an appeal to the superior powers, is supposed to come within their cognizance alone, and that it is contrary to the spirit of the customs of these people, to punish a perjury by human means, even if it were clearly detected; yet, so far prevalent is the opinion of their interposition in human affairs, that it is very seldom any man of substance, or who has a family that he fears may suffer by it, will venture to forswear himself; nor are there wanting apparent examples to confirm them in this notion. Any accident that happens to a man, who has been known to take a false oath, or to his children or grandchildren, is carefully recorded in memory, and attributed to this sole cause. The dupati of Gunong Selong and his family have afforded an instance
instance that is often quoted among the Rejangs, and has evidently had great weight. It was notorious, that he had, about the year 1770, taken in the most solemn manner, a false oath. He had at that time five sons grown up to manhood. One of them, soon after, in a scuffle with some bugis (country soldiers) was wounded, and died. The dupati, the next year, lost his life in the issue of a disturbance he had raised in the district. Two of the sons died afterwards, within a week of each other. Mas Kaddah, the fourth, is blind; and Treman, the fifth, lame. All this is attributed to, and firmly believed to be the consequence of, the father's perjury.

In administering an oath, if the matter litigated respects the property of the grandfather, all the collateral branches of the family descended from him, are understood to be included in its operation: if the father's effects only are concerned, or the transaction happened in his life time, his descendants are included: if the affair regards only the present parties, and originated with them, they and their immediate descendants only, are comprehended in the consequences of the oath; and if any single one of these descendants refuses to join in the oath, it vitiates the whole; that is, it has the same effect, as if the party himself refused to swear; a case that not unfrequently occurs. It may be observed that the spirit of this custom tends to the requiring a weight of evidence, and an increase of the importance of the oath, in proportion as the distance of time renders the fact to be established less capable of proof in the ordinary way.

Sometimes the difficulty of the case alone, will induce the court to insist on administering the oath to the relations of the parties, although they are nowise concerned in the transaction. I recollect an instance where three people were prosecuted for a theft. There was no positive proof against them, yet the circumstances were so strong, that it appeared proper to put them to the test of one of these collateral oaths. They were all willing, and two of them swore. When it came to the turn of the third, he could not persuade his relations to join with him, and he was accordingly brought in for the whole amount of the goods stolen, and penalties annexed.
These customs bear a strong resemblance to the rules of proof established among our ancestors, the Anglo-Saxons, who were likewise obliged, in the case of oaths taken for the purpose of exculpation, to produce a certain number of compurgators; but, as these might be any indifferent persons, who would take upon them to bear testimony to the truth of what their neighbour swore, from an opinion of his veracity, there seems to be more refinement, and more knowledge of human nature in the Sumatran practice. The idea of devoting to destruction, by a wilful perjury, not himself only, but all, even the remotest branches of a family which constitutes his greatest pride, and of which the deceased heads are regarded with the veneration that was paid to the dii lares of the antients, has doubtless restrained many a man from taking a false oath, who, without much compunction, would suffer thirty or an hundred compurgators of the former description to take their chance of that fate. Their strongest prejudices are here converted to the most beneficial purposes.

The place of greatest solemnity for administering an oath, is the krammat or burying ground of their ancestors, and several superstitious ceremonies are observed on the occasion. The people near the sea-coast, in general, by long intercourse with the Malays, have an idea of the Korān, and usually employ this in swearing, which the priests do not fail to make them pay for; but the inland people keep, laid up in their houses, certain old relics, called in the Rejang language pesakko, and in Malayan, saction, which they produce when an oath is to be taken. The person who has lost his cause, and with whom it commonly rests to bind his adversary by an oath, often desires two or three days' time, to get ready these his swearing apparatus, called on such occasions sumpahan, of which some are looked upon as more sacred, and of greater efficacy than others. They consist of an old rusty kris, a broken gun barrel, or any antient trumpery, to which chance or caprice has annexed an idea of extraordinary virtue. These they generally dip in water, which the person who swears drinks off, after having pronounced the form of words before-mentioned.* The panigeran of Sunĝei-lamo has by him cer-

* The form of taking an oath among the people of Madagascar very nearly resembles the ceremonies used by the Sumatrans. There is a strong similarity in the articles they swear on, and in the circumstance of their drinking the consecrated water.
tain copper bullets, which had been steeped in water, drunk by the Suñgei-etam chiefs, when they bound themselves never to molest his districts: which they have only done since, as often as they could venture it with safety, from the relaxation of our government. But these were political oaths. The most ordinary sumpahan is a kris, and on the blade of this they sometimes drop lime-juice, which occasions a stain on the lips of the person performing the ceremony; a circumstance that may not improbably be supposed to make an impression on a weak and guilty mind. Such would fancy that the external stain conveyed to the beholders an image of the internal. At Manna the sumpahan most respected is a gun barrel. When produced to be sworn on, it is carried to the spot in state, under an umbrella, and wrapt in silk. This parade has an advantageous effect, by influencing the mind of the party, with an high idea of the importance and solemnity of the business. In England, the familiarity of the object, and the summary method of administering oaths, are well known to diminish their weight, and to render them too often nugatory. They sometimes swear by the earth, laying their hands upon it, and wishing that it may never produce aught for their nourishment, if they speak falsely. In all these ceremonies, they burn on the spot a little gum benzoin—" Et acerra thuris plena, postitusque carbo in cespite vivo."

It is a striking circumstance, that practices which boast so little of reason in their foundation; which are in fact so whimsical and childish, should yet be common to nations, the most remote in situation, climate, language, complexion, character, and every thing that can distinguish one race of people from another. Formed of like materials, and furnished with like original sentiments, the uncivilized tribes of Europe and of India, trembled from the same apprehensions, excited by similar ideas, at a time when they were ignorant, or even denied the possibility of each other's existence. Mutual wrong and animosity, attended with disputes and accusations, are not by nature confined to either description of people. Each, in doubtful litigations, might seek to prove their innocence, by braving, on the justice of their cause, those objects which inspired amongst their countrymen, the greatest terour. The Sumatran, impressed with an idea of invisible powers, but not of his own immor-
tality, regards with awe the supposed instruments of their agency, and swears on krises, bullets, and gun barrels; weapons of personal destruction. The German Christian of the seventh century, more indifferent to the perils of this life, but not less superstitious, swore on bits of rotten wood, and rusty nails, which he was taught to revere, as possessing efficacy to secure him from eternal perdition.

Inheritance. When a man dies, his effects, in common course, descend to his male children in equal shares; but if one among them is remarkable for his abilities above the rest, though not the eldest, he usually obtains the largest proportion, and becomes the head of the tunggūan or house; the others voluntarily yielding him the superiority. A pañgeran of Manna left several children; none of them succeeded to the title, but a name of distinction was given to one of the younger, who was looked upon as chief of the family, after the father’s decease. Upon asking the eldest how it happened that the name of distinction passed over him, and was conferred on his younger brother, he answered with great naiveté, “because I am accounted weak and silly.” If no male children are left, and a daughter only remains, they contrive to get her married by the mode of ambel anak, and thus the tunggūan of the father continues. An equal distribution of property among children is more natural, and conformable to justice, than vesting the whole in the eldest son, as prevails throughout most part of Europe; but where wealth consists in landed estate, the latter mode, beside favouring the pride of family, is attended with fewest inconveniences. The property of the Sumatrans being personal merely, this reason does not operate with them. Land is so abundant in proportion to the population, that they scarcely consider it as the subject of right, any more than the elements of air and water; excepting so far as in speculation the prince lays claim to the whole. The ground, however, on which a man plants or builds, with the consent of his neighbours, becomes a species of nominal property, and is transferable; but as it costs him nothing, beside his labour, it is only the produce which is esteemed of value, and the compensation he receives is for this alone. A temporary usufruct is accordingly all that they attend to, and the price, in case of sale, is generally ascertained by the coconut, durian, and other fruit trees, that have been planted on it; the buildings being
for the most part but little durable. Whilst any of those subsist, the descendants of the planter may claim the ground, though it has been for years abandoned. If they are cut down, he may recover damages; but if they have disappeared in the course of nature, the land reverts to the public.

They have a custom of keeping by them a sum of money, as a resource against extremity of distress, and which common exigencies do not call forth. This is a refined antidote against despair, because, whilst it remains possible to avoid encroaching on that treasure, their affairs are not at the worst, and the idea of the little hoard serves to buoy up their spirits, and encourage them to struggle with wretchedness. It usually, therefore, continues inviolate, and descends to the heir, or is lost to him by the sudden exit of the parent. From their apprehension of dishonesty, and insecurity of their houses, their money is for the most part concealed in the ground, the cavity of an old beam, or other secret place; and a man, on his death-bed, has commonly some important discovery of this nature to make to his assembled relations.

The practice of outlawing an individual of a family by the head of it (called lepas or buang dān-gān surat, to let loose, or cast out with a writing) has its foundation in the custom which obliges all the branches to be responsible for the debts contracted by any one of the kindred. When an extravagant and unprincipled spendthrift is running a career that appears likely to involve his family in ruinous consequences, they have the right of dissolving the connexion, and clearing themselves of further responsibility, by this public act, which, as the writ expresses it, sends forth the outcast, as a deer into the woods, no longer to be considered as enjoying the privileges of society. This character is what they term risau, though it is sometimes applied to persons not absolutely outlawed, but of debauched and irregular manners.

In the Saxon law we find a strong resemblance to this custom; the kindred of a murderer being exempt from the feud, if they abandoned him to his fate. They bound themselves in this case neither to converse with him, nor to furnish him with meat or other necessaries. This is precisely
precisely the Sumatran outlawry, in which it is always particularly specified (beside what relates to common debts) that if the outlaw kills a person, the relations shall not pay the compensation, nor claim it if he is killed. But the writ must have been issued before the event, and they cannot free themselves by a subsequent process, as it would seem the Saxons might. If an outlaw commits murder, the friends of the deceased may take personal revenge on him, and are not liable to be called to an account for it; but if such be killed, otherwise than in satisfaction for murder, although his family have no claim, the prince of the country is entitled to a certain compensation, all outlaws being nominally his property, like other wild animals.

Compensation for murder. It seems strange to those who are accustomed to the severity of penal laws, which in most instances inflict punishment exceeding by many degrees the measure of the offence, how a society can exist, in which the greatest of all crimes is, agreeably to established custom, expiated by the payment of a certain sum of money; a sum not proportioned to the rank and ability of the murderer, nor to the premeditation, or other aggravating circumstances of the fact, but regulated only by the quality of the person murdered. The practice had doubtless its source in the imbecility of government, which being unable to enforce the law of retaliation, the most obvious rule of punishment, had recourse to a milder scheme of retribution, as being preferable to absolute indemnity. The latter it was competent to carry into execution, because the guilty persons readily submit to a penalty which effectually relieves them from the burthen of anxiety for the consequences of their action. Instances occur in the history of all states, particularly those which suffer from internal weakness, of iniquities going unpunished, owing to the rigour of the pains denounced against them by the law, which defeats its own purpose. The original mode of avenging a murder, was probably by the arm of the person nearest in consanguinity, or friendship, to the deceased; but this was evidently destructive of the public tranquillity, because thereby the wrong became progressive, each act of satisfaction, or justice, as it was called, being the source of a new revenge, till the feud became general in the community; and some method would naturally be suggested to put a stop to such confusion. The most direct step is to vest in the magistrate or
or the law the rights of the injured party, and to arm them with a vindictive power; which principle, the policy of more civilized societies has refined to that of making examples in terrorem, with a view of preventing future, not of revenging past crimes. But this requires a firmness of authority to which the Sumatran governments are strangers. They are without coercive power, and the submission of the people is little other than voluntary; especially of the men of influence, who are held in subjection rather by the sense of general utility planted in the breast of mankind, attachment to their family and connexions, and veneration for the spot in which their ancestors were interred, than by the apprehension of any superior authority. These considerations, however, they would readily forego, renounce their fealty, and quit their country, if in any case they were in danger of paying with life, the forfeit of their crimes; to lesser punishments those ties induce them to submit; and to strengthen this hold, their customs wisely enjoin that every the remotest branch of the family shall be responsible for the payment of their adjudged and other debts; and in cases of murder, the bangun, or compensation, may be levied on the inhabitants of the village the culprit belonged to, if it happens that neither he, nor any of his relations can be found.

The equality of punishment, which allows to the rich man the faculty of committing, with small inconvenience, crimes that bring utter destruction on the poor man and his family, and which is in fact the greatest inequality, originates certainly from the interested design of those through whose influence the regulation came to be adopted. Its view was to establish a subordination of persons. In Europe, the absolute distinction between rich and poor, though too sensibly felt, is not insisted upon in speculation, but rather denied or explained away in general reasoning. Among the Sumatrans it is coolly acknowledged, and a man without property, family, or connexions, never, in the partiality of self-love, considers his own life as being of equal value with that of a man of substance. A maxim, though not the practice, of their law, says, "that he who is able to pay the bangun for murder, must satisfy the relations of the deceased; he who is unable, must suffer death." But the avarice of the relations prefers selling the body of the delinquent for what his slavery
slavery will fetch them (for such is the effect of imposing a penalty that cannot be paid) to the satisfaction of seeing the murder revenged by the public execution of a culprit of that mean description. Capital punishments are, therefore, almost totally out of use among them; and it is only par la loi du plus fort, that the Europeans take the liberty of hanging a notorious criminal, now and then; whom, however, their own chiefs always condemn, and formally sentence.

Corporal punishment of any kind is rare. The chain, and a sort of stocks, made of the pinang tree, are adopted from us; the word “pasong,” now commonly used to denote the latter, originally signifying, and being still frequently applied to confinement in general. A kind of cage made use of in the country, is probably their own invention. “How do you secure a prisoner, (a man was asked) without employing a chain or our stocks?” “We pen him up,” said he, “as we would a bear.” The cage is made of bambooos laid horizontally, in a square, piled alternately, secured by timbers at the corners, and strongly covered in at top. To lead a runaway, they fasten a rattan round his neck, and passing it through a bamboo somewhat longer than his arms, they bring his hands together and make them fast to the bamboo, in a state rather of constraint than of pain, which, I believe, never is wantonly or unnecessarily inflicted. If the offender is of a desperate character, they bind him hands and feet, and sling him on a pole. When they would convey a person, from accident or otherwise unable to walk, they make a palanquin by splitting a large bamboo near the middle of its length, where they contrive to keep it open, so that the cavity forms a bed; the ends being preserved whole, to rest upon their shoulders.

The custom of exacting the bañgun for murder, seems only designed with a view of making a compensation to the injured family, and not of punishing the offender. The word signifies “awaking” or “raising up,” and the deceased is supposed to be replaced, or raised again to his family, in the payment of a sum proportioned to his rank, or equivalent to his or her personal value. The price of a female slave is generally more than that of a male, and therefore, I heard a chief say, is the bañgun of a woman more than that of a man. It is upon this principle
that their laws take no cognizance of the distinction between a wilful murder, and what we term manslaughter. The loss is the same to the family, and therefore the compensations are alike. A dupati of Laye, in an ill hour, stept unwarily across the mouth of a cannon, at the instant it was fired off for a salute, and was killed by the explosion; upon which his relations immediately sued the serjeant of the country-guard, who applied the match, for the recovery of the bañgun; but they were cast, and upon these grounds; that the dupati was instrumental in his own death, and that the Company's servants being amenable to other laws for their crimes, were not, by established custom, subject to the bañgun or other penalties inflicted by the native chiefs, for accidents resulting from the execution of their duty. The tippong bumi, expiation, or purification of the earth from the stain it has received, was, however, gratuitously paid. No plea was set up, that the action was unpremeditated, and the event chance-medley.

The introduction of this custom is beyond the extent of Sumatran tradition, and has no connexion with, or dependance on, Mahometanism, being established amongst the most inland people from time immemorial. In early ages it was by no means confined to that part of the world. The bañgun is perfectly the same as the compensation for murder in the rude institutions of our Saxon ancestors, and other northern nations. It is the eric of Ireland, and the æreon of the Greeks. In the compartments of the shield of Achilles, Homer describes the adjudgment of a fine for homicide. It would seem then to be a natural step in the advances from anarchy to settled government, and that it can only take place in such societies as have already a strong idea of the value of personal property; who esteem its possession of the next importance to that of life, and place it in competition with the strongest passion that seize the human soul.

The compensation is so regularly established among the Sumatrans, that any other satisfaction is seldom demanded. In the first heat of resentment retaliation is sometimes attempted, but the spirit soon evaporates, and application is usually made, upon the immediate discovery of the fact, to the chiefs of the country, for the exertion of their influence,
ence, to oblige the criminal to pay the ban gunshot. His death is then not thought of, unless he is unable, and his family unwilling, to raise the established sum. Instances, it is true, occur, in which the prosecutor knowing the European law in such case, will, from motives of revenge, urge to the Resident the propriety of executing the offender, rather than receive the money; but if the latter is ready to pay it, it is contrary to their laws to proceed further. The degree of satisfaction that attends the payment of the ban gunshot, is generally considered as absolute to the parties concerned; they receive it as full compensation, and pretend to no farther claim upon the murderer and his family. Slight provocations, however, have been sometimes known to renew the feud, and there are not wanting instances of a son's revenging his father's murder, and willingly refunding the ban gunshot. When, in an affray, there happen to be several persons killed on both sides, the business of justice is only to state the reciprocal losses, in the form of an account current, and order the balance to be discharged, if the numbers be unequal. The following is a relation of the circumstances of one of these bloody feuds, which happened whilst I was in the island; but which become every year more rare, where the influence of our government extends.

Raddin Siban was the head of a tribe in the district of Manna, of which Pangeran Raja-Kalippah was the official chief; though by the customs of the country he had no right of sovereignty over him. The pangeran's not allowing him what he thought an adequate share of fines, and other advantages annexed to his rank, was the foundation of a jealousy and ill will between them, which an event that happened a few years since, raised to the highest pitch of family feud. Lessut, a younger brother of the pangeran, had a wife who was very handsome, and whom Raddin Siban had endeavoured to procure, whilst a virgin, for his younger brother, who was in love with her: but the pangeran had contrived to circumvent him, and obtained the girl for Lessut. However, it seems the lady herself had conceived a violent liking for the brother of Raddin Siban, who found means to enjoy her after she was married, or was violently suspected so to have done. The consequence was, that Lessut killed him, to revenge the dishonour of his bed. Upon this the families were
were presently up in arms, but the English Resident interfering, preserved the peace of the country, and settled the affair agreeably to the customs of the place, by bañ gan and fine. But this did not prove sufficient to extinguish the fury which raged in the hearts of Raddin Siban's family, whose relation was murdered. It only served to delay the revenge until a proper opportunity offered of gratifying it. The people of the country being called together on a particular occasion, the two inimical families were assembled, at the same time, in Manna bazar. Two younger brothers (they had been five in all) of Raddin Siban, going to the cockpit, saw Raja Muda the next brother of the pangeran, and Lessut his younger brother, in the open part of a house which they passed. They quickly returned, drew their kris, and attacked the pangeran's brothers, calling to them, "if they were men, to defend themselves." The challenge was instantly accepted, Lessut, the unfortunate husband, fell; but the aggressors were both killed by Raja Muda, who was himself much wounded. The affair was almost over before the scuffle was perceived. The bodies were lying on the ground, and Raja Muda was supporting himself against a tree which stood near the spot, when Raddin Siban, who was in a house on the opposite side of the bazar at the time the affray happened, being made acquainted with the circumstances, came over the way, with his lance in his hand. He passed on the contrary side of the tree, and did not see Raja Muda, but began to stab with his weapon the dead body of Lessut, in excess of rage, on seeing the bloody remains of his two brothers. Just then, Raja Muda, who was half dead, but had his kris in his hand, still unseen by Raddin Siban, crawled a step or two, and thrust the weapon into his side, saying "Matti kau"—"die thou!" Raddin Siban spoke not a word, but put his hand on the wound, and walked across to the house from whence he came, at the door of which he dropped down and expired. Such was the catastrophe. Raja Muda survived his wounds, but being much deformed by them, lives a melancholy example of the effects of these barbarous feuds.

In cases of theft, the swearing a robbery against a person suspected is of no effect, and justly, for were it otherwise, nothing would be more common than the prosecution of innocent persons. The proper proofs
are either, seizure of the person in the fact, before witnesses, or discovery of the goods stolen, in possession of one who can give no satisfactory account how he came by them. As it frequently happens that a man finds part only of what he had lost, it remains with him, when the robbery is proved, to ascertain the whole amount, by oath, which in that point is held sufficient.

The law which renders all the members of a family reciprocally bound for the security of each others debts, forms a strong connexion among them, and occasions the elder branches to be particularly watchful of the conduct of those, for whose imprudence they must be answerable.

When a debtor is unable to pay what he owes, and has no relation or friends capable of doing it for him; or when the children of a deceased person do not find property enough to discharge the debts of their parent, they are forced to the state which is called mengiring, which simply means to follow or be dependant on, but here implies the becoming a species of bondslaves to the creditor, who allows them subsistance and clothing, but does not appropriate the produce of their labour to the diminution of their debt. Their condition is better than that of pure slavery, in this, that the creditor cannot strike them, and they can change their masters, by prevailing on another person to pay their debt, and accept of their labour on the same terms. Of course they may obtain their liberty, if they can by any means procure a sum equal to their debt; whereas a slave, though possessing ever so large property, has not the right of purchasing his liberty. If, however, the creditor shall demand formally the amount of his debt, from a person mengiring, at three several times, allowing a certain number of days between each demand, and the latter is not able to persuade any one to redeem him, he becomes, by the custom of the country, a pure slave; upon the creditor's giving notice to the chief, of the transaction. This is the resource he has against the laziness or untoward behaviour of his debtor, who might otherwise, in the state of mengiring, be only a burthen to him. If the children of a deceased debtor are too young to be of service, the charge of their mainten

---

**Law respecting debts.**
tenance is added to the debt. This opens a door for many iniquitous practices, and it is in the rigorous, and frequently perverted, exertion of these rights, which a creditor has over his debtor, that the chiefs are enabled to oppress the lower class of people, and from which abuses the English Residents find it necessary to be the most watchful to restrain them. In some cases, one half of the produce of the labour is applied to the reduction of the debt, and this situation of the insolvent debtor is termed be-blah. Meranggau is the condition of a married woman who remains as a pledge for a debt in the house of the creditor of her husband. If any attempt should be made upon her person, the proof of it annuls the debt; but should she bring an accusation of that nature, and be unable to prove it to the satisfaction of the court, and the man takes an oath in support of his innocence, the debt must be immediately paid by the family, or the woman be disposed of as a slave.

When a man of one district or country has a debt owing to him from the inhabitant of a neighbouring country, of which he cannot recover payment, an usual resource is to seize on one or more of his children, and carry them off; which they call andak. The daughter of a Rejang dupati was carried off in this manner by the Labun people. Not hearing for some time from her father, she sent him cuttings of her hair and nails, by which she intimated a resolution of destroying herself, if not soon released.

The right of slavery is established in Sumatra, as it is throughout the East, and has been all over the world; yet but few instances occur of the country people actually having slaves; though they are common enough in the Malayan, or sea-port towns. Their domestics and labourers are either dependant relations, or the orang mengiring above described, who are usually called debtors; but should be distinguished by the term of insolvent debtors. The simple manners of the people require that their servants should live, in a great measure, on a footing of equality with the rest of the family, which is inconsistent with the authority necessary to be maintained over slaves, who have no principle to
to restrain them but that of personal fear, and know that their civil condition cannot be altered for the worse. There is this advantage, also, that when a debtor absconds, they have recourse to his relations for the amount of his debt, who, if unable to pay it, must meagiring in his room; whereas, when a slave makes his escape, the law can give no redress, and his value is lost to the owner. These people, moreover, are from habit, backward to strike, and the state of slavery unhappily requires the frequent infliction of punishment in that mode. A slave cannot possess, independently, any property; yet it rarely happens that a master is found mean and sordid enough to despoil them of the fruits of their industry; and their liberty is generally granted them, when in a condition to purchase it, though they cannot demand it of right. It is nothing uncommon for those belonging to the Europeans, to possess slaves of their own, and to acquire considerable substance. Their condition is here, for the most part, less unhappy than that of persons in other situations of life. I am far from wishing to diminish the horror that should ever accompany the general idea of a state, which, whilst it degrades the species, I am convinced is not necessary among mankind; but I cannot help remarking, as an extraordinary fact, that if there is one class of people eminently happy above all others upon earth, it is the body of Caffres, or negro slaves belonging to the India Company at Bencoolen. They are well clothed and fed, and supplied with a proper allowance of liquor; their work is by no means severe; the persons appointed as their immediate overseers, are chosen, for their merit, from amongst themselves; they have no occasion of care or anxiety for the past or future, and are naturally of a lively and open temper.

* I do not mean to assert, that all men in the condition of slaves are devoid of principle: I have experienced the contrary, and found in them affection and strict honesty: but that there does not result from their situation, as slaves, any principle of moral rectitude; whereas every other condition of society has annexed to it, ideas of duty and mutual obligation, arising from a sense of general utility. That sublime species of morality derived from the injunctions of religion, it is almost universally their fate to be likewise strangers to; because slavery is found inconsistent with the spirit of the gospel, not merely as inculcating philanthropy, but inspiring a principle of equality amongst mankind.
The contemplation of the effects which such advantages produce, must afford the highest gratification to a benevolent mind. They are usually seen laughing or singing whilst at work, and the intervals allowed them are mostly employed in dancing to their rude instrumental music, which frequently begins at sun-set, and ceases only with the day-light, that recals them to their labour. Since they were first carried thither, from different parts of Africa and Madagascar, to the present hour, not so much as the rumour of disturbance or discontent has ever been known to proceed from them. They hold the natives of the island in contempt, have a degree of antipathy towards them, and enjoy any mischief they can do them; and these in their turn regard the Caffres as devils half humanized.

The practice said to prevail elsewhere, of men selling themselves for slaves, is repugnant to the customs of the Sumatrans, as it seems to reason. It is an absurdity to barter any thing valuable, much more civil existence, for a sum which, by the very act of receiving, becomes again the property of the buyer. Yet, if a man runs in debt, without a prospect of paying, he does virtually the same thing, and this, in cases of distress, is not uncommon; in order to relieve, perhaps, a beloved wife, or favourite child, from similar bondage. A man has even been known to apply in confidence to a friend, to sell him to a third person, concealing from the purchaser the nature of the transaction till the money was appropriated.

Ignorant stragglers are often picked up in the country, by lawless knaves in power, and sold beyond the hills. These have sometimes procured their liberty again, and prosecuting their kidnappers, have recovered large damages. In the district of Allas, a custom prevails, by which, if a man has been sold to the hill people, however unfairly, he is restricted on his return from associating with his countrymen, as their equal, unless he brings with him a sum of money, and pays a fine for his re-enfranchisement, to his kalippah or chief. This regulation has taken its rise from an idea of contamination, among the people, and from art and avarice among the chiefs.
By much the greater number of the legal disputes, among these people, have their source in the intricacy attending their marriage contracts. In most uncivilized countries these matters are very simple, the dictates of nature being obeyed, or the calls of appetite satisfied, with little ceremony, or form of convention; but with the Sumatrans, the difficulties, both precedent and subsequent, are increased to a degree unknown even in the most refined states. To remedy these inconveniences, which might be supposed to deter men from engaging in marriage, was the view of the Resident of Laye, beforementioned, who prevailed upon them to simplify their engagements, as the means of preventing litigation between families, and of increasing the population of the country. How far his liberal views will be answered, by having thus influenced the people to change their customs; whether they will not soon relapse into the ancient track; and whether, in fact, the cause that he supposed, did actually contribute to retard population, I shall not pretend to determine; but as the last is a point on which a difference of opinion prevails, I shall take the liberty of quoting here, the sentiments of another servant of the Company (the late Mr. John Crisp) who possessed an understanding highly enlightened.

“...This part of the island is in a low state of population, but it is an error to ascribe this to the mode of obtaining wives by purchase. The circumstance of children constituting part of the property of the parents, proves a most powerful incentive to matrimony, and there is not, perhaps, any country on the face of the earth, where marriage is more general than here, instances of persons of either sex passing their lives in a state of celibacy, being extremely rare. The necessity of purchasing does not prove such an obstacle to matrimony, as is supposed. Was it indeed true...
true that every man was obliged to remain single, till he had accumulated, from the produce of his pepper-garden, a sum adequate to the purchase of a wife; married pairs would truly be scarce. But the people have other resources; there are few families who are not in possession of some small substance; they breed goats and buffaloes, and in general keep in reserve some small sum for particular purposes. The purchase-money of the daughter serves also to provide wives for the sons. Certain it is, that the fathers are rarely at a loss for money to procure them wives, so soon as they become marriageable. In the districts under my charge are about eight thousand inhabitants, among whom I do not conceive it would be possible to find ten instances of men of the age of thirty years unmarried. We must then seek for other causes of the paucity of inhabitants, and indeed they are sufficiently obvious; among these, we may reckon that the women are by nature unprolific, and cease gestation at an early age; that, almost totally unskilled in the medical art, numbers fall victims to the endemic diseases of a climate, nearly as fatal to its indigenous inhabitants, as to the strangers who settle among them: to which we may add, that the indolence and inactivity of the natives, tend to relax and enervate the bodily frame, and to abridge the natural period of their lives."

The modes of marriage, according to the original institutions of these people, are by jujur, by ambel anak, or by semando. The jujur is a certain sum of money, given by one man to another, as a consideration for the person of his daughter, whose situation, in this case, differs not much from that of a slave to the man she marries, and to his family. His absolute property in her depends, however, upon some nice circumstances. Beside the batang jujur (or main sum), there are certain appendages or branches, one of which, the tali kulo, of five dollars, is usually, from motives of delicacy or friendship, left unpaid, and so long as that is the case, a relationship is understood to subsist between the two families, and the parents of the woman have a right to interfere on occasions of ill treatment: the husband is also liable to be fined for wounding her; with other limitations of absolute right. When that sum is finally paid, which seldom happens but in cases of violent quarrel, the tali kulo (tie of relationship) is said to be putus (broken), and the woman becomes
to all intents the slave of her lord. She has then no title to claim a divorce in any predicament; and he may sell her, making only the first offer to her relations. The other appendages, as already mentioned, are the *tulis taniggil* (the meaning of which I cannot satisfactorily ascertain, this and many other of the legal terms being in the *Rejang* or the *Pas-summah* and not the Malayan language) and the *upah dawn kodo*, which is a consideration for the expanse of the marriage feast, paid to the girl’s parent, who provides it. But sometimes it is deposited at the wedding, when a distribution is made of it amongst the old people present. The words allude to the *leaf* in which the rice is served up. These additional sums are seldom paid or claimed, before the principal is defrayed, of which a large proportion, as fifty, eighty, and sometimes an hundred and four dollars, is laid down at the time of marriage, or in the first visit (after the parties are determined in their regards) made by the father of the young man, or the *bujang* himself, to the father of the woman. Upon opening his design this money is tendered as a present, and the other’s acceptance of it is a token that he is inclined to forward the match. It lies often in his hands three, six, or twelve months before the marriage is consummated. He sometimes sends for more, and is seldom refused. Until at least fifty dollars are thus deposited, the man cannot take his wife home; but so long as the matter continues *dalam rasa-an* (under consideration)

* I cannot omit to remark here, that however opposite the word *tali*, which in Malayan signifies a cord, may be to the subject of the marriage tie, there is very strong evidence of the term, as applied to this ceremony, having been adopted from the customs of the Hindu inhabitants of the peninsula of India, in whose language it has a different meaning. Among others who have described their rites is M. Sonnerat. In speaking of the mode of marriage called *pariam*, which, like the *jujur*, “n’est autre chose qu’un achat que le mari fait de sa femme,” he says, “le mari doit aussi fournir le *tali*, petit joyau d’or, qu’il attache avec un cordon au col de la fille; c’est la dernière cérémonie; elle donne la sanction au mariage, qui ne peut plus être rompu dès que le *tali* est attaché.” *Voyage aux Indes, &c.* tom. I. p. 70. The reader will also find the Sumatran mode of marriage by *ambel anak*, or adoption, exactly described at p. 72. An engraving of the *tali* is given by P. Paolino, *Systema Brahmanicum*, tab. xxii. This resemblance is not confined to the rites of marriage, for it is remarked by Sir W. Jones that, “among the laws of the Sumatrans two positive rules concerning sureties and interest appear to be taken word for word from the Indian legislators.” As, Res. Vol. III. p. 9.
SUMATRA.

consideration) it would be deemed scandalous in the father to listen to any other proposals. When there is a difficulty in producing the necessary sum, it is not uncommon to resort to an expedient termed *meṅgir-ing jujur*, that is, to continue a debtor with the family until he can raise money sufficient to redeem himself; and after this, long credit is usually given for the remainder. Years often elapse, if the families continue on good terms, without the debt being demanded, particularly when an hundred and four dollars have been paid, unless distress obliges them to it. Sometimes it remains unadjusted to the second and third generation, and it is not uncommon to see a man suing for the *jujur* of the sister of his grandfather. These debts constitute, in fact, the chief part of their substance; and a person is esteemed rich who has several of them due to him, for his daughters, sisters, aunts, and great aunts. Debts of this nature are looked upon as sacred, and are scarcely ever lost. In *Passummah*, if the race of a man is extinct, and some of these remain unpaid, the dusun or village to which the family belonged, must make it good to the creditor; but this is not insisted upon amongst the *Rejangs*.

In lieu of paying the *jujur*, a barter transaction, called *libei*, sometimes takes place, where one *gadis* (virgin) is given in exchange for another; and it is not unusual to borrow a girl for this purpose, from a friend or relation, the borrower binding himself to replace her, or pay her *jujur*, when required. A man who has a son and daughter, gives the latter in exchange for a wife to the former. The person who receives her, disposes of her as his own child, or marries her himself. A brother will give his sister in exchange for a wife, or, in default of such, procure a cousin for the purpose. If the girl given in exchange be under age, a certain allowance per annum is made, till she becomes marriageable. *Begappok* is a mode of marriage differing a little from the common *jujur*, and, probably, only taking place where a parent wants to get off a child labouring under some infirmity or defect. A certain sum is in this case fixed, below the usual custom, which, when paid, is in full for her value, without any appendages. In other cases likewise, the *jujur* is sometimes lessened, and sometimes increased, by mutual agreement; but on trials it is always estimated at an hundred and twenty dollars. If
SUMATRA.

A wife dies soon after marriage, or at any time without children, the full jujur cannot be claimed; it is reduced to eighty dollars; but should more than that have been laid down in the interim, there is no refunding. The jujur of a widow, which is generally eighty dollars, without appendages, is again reduced upon a third marriage, allowances being made for dilapidation. A widow, being with child, cannot marry again till she is delivered, without incurring a penalty. In divorces it is the same. If there be no appearance of pregnancy, she must yet abstain from making another choice, during the period of three months and ten days.

When the relations and friends of the man go in form to the parents of the girl to settle the terms of the marriage, they pay at that time the adat besasala, or earnest, of six dollars generally; and these kill a goat or a few fowls to entertain them. It is usually some space of time (except in cases of telari gadis or elopement) after the payment of the besasala, before the wedding takes place; but, when the father has received that, he cannot give his daughter to any other person, without incurring a fine; which the young lady sometimes renders him liable to; for whilst the old folk are planning a match by patutan, or regular agreement between families, it frequently happens that miss disappears with a more favoured swain, and secures a match of her own choice. The practice styled telari gadis, is not the least common way of determining a marriage, and from a spirit of indulgence and humanity, which few codes can boast, has the sanction of the laws. The father has only the power left, of dictating the mode of marriage, but cannot take his daughter away, if the lover is willing to comply with the custom in such cases. The girl must be lodged, unviolated, in the house of some respectable family, till the relations are advised of the enlèvement, and settle the terms. If, however, upon immediate pursuit, they are overtaken on the road, she may be forced back, but not after she has taken sanctuary.

By the Mosaic law, if a man left a widow, without children, his brother was to marry her. Among the Sumatrans, with or without children, the brother, or nearest male relation of the deceased, unmarried,
(the father excepted) takes the widow. This is practised both by Malays and country people. The brother, in taking the widow to himself, becomes answerable for what may remain due of her purchase money, and in every respect represents the deceased. This is phrased ganti tikar bantal’nia—supplying his place on his mat and pillow.

Chastity prevails more, perhaps, among these than any other people. It is so materially the interest of the parents to preserve the virtue of their daughters unsullied, as they constitute the chief of their substance, that they are particularly watchful in this respect. But as marriages in general do not take place so early as the forwardness of nature in that climate would admit, it will sometimes happen, notwithstanding their precaution, that a young woman, not chusing to wait her father’s pleasure, tastes the fruit by stealth. When this is discovered, he can oblige the man to marry her, and pay the jujur; or, if he chuses to keep his daughter, the seducer must make good the difference he has occasioned in her value, and also pay the fine, called tippong bumi, for removing the stain from the earth. Prostitution for hire is, I think, unknown in the country, and confined to the more polite bazars, where there is usually a concourse of sailors and others, who have no honest settlement of their own, and whom, therefore, it is impossible to restrain from promiscuous concubinage. At these places, vice generally reigns in a degree proportioned to the number and variety of people of different nations who inhabit them, or occasionally resort thither. From the scenes which these sea-ports present, travellers too commonly form their judgment, and imprudently take upon them to draw, for the information of the world, a picture of the manners of a people.

The different species of horrid and disgustful crimes, which are emphatically denominated, against nature, are unknown on Sumatra; nor have any of their languages terms to express such ideas.

Incest, or the intermarriage of persons within a certain degree of consanguinity, which is, perhaps, (at least after the first degree) rather an offence against the institutions of human prudence, than a natural crime, is forbidden by their customs, and punishable by fine: yet the guilt is often
often expiated by a ceremony, and the marriages, in many instances, confirmed.

**Adultery.**

Adultery is punishable by fine; but the crime is rare, and suits on the subject still less frequent. The husband, it is probable, either conceals his shame, or revenges it with his own hand.

**Divorces.**

If a man would divorce a wife he has married by *jujur*, he may claim back what he has paid in part, less twenty-five dollars, the *adat charo*, for the damage he has done her; but if he has paid the *jujur* in full, the relations may chuse whether they will receive her or not; if not, he may sell her. If a man has paid part of a *jujur*, but cannot raise the remainder, though repeatedly dunned for it, the parents of the girl may obtain a divorce; but if it is not with the husband’s concurrence, they lose the advantage of the *charo*, and must refund all they have received. A woman married by *jujur* must bring with her, effects to the amount of ten dollars, or, if not, it is deducted from the sum; if she brings more, the husband is accountable for the difference. The original ceremony of divorce consists in cutting a rattan-cane in two, in presence of the parties, their relations, and the chiefs of the country.

**Second mode of marriage.**

In the mode of marriage by *ambel anak*, the father of a virgin makes choice of some young man for her husband, generally from an inferior family, which renounces all further right to, or interest in, him, and he is taken into the house of his father-in-law, who kills a buffalo on the occasion, and receives twenty dollars from the son’s relations. After this, the *buruk baik’nia* (the good and bad of him) is vested in the wife’s family. If he murders or robs, they pay the *baṅgun*, or the fine. If he is murdered, they receive the *baṅgun*. They are liable to any debts he may contract after marriage; those prior to it remaining with his parents. He lives in the family, in a state between that of a son and a debtor. He partakes as a son of what the house affords, but has no property in himself. His rice plantation, the produce of his pepper garden, with every thing that he can gain or earn, belong to the family. He is liable to be divorced at their pleasure, and though he has children, must
must leave all, and return naked as he came. The family sometimes indulge him with leave to remove to a house of his own, and take his wife with him; but he, his children, and effects, are still their property. If he has not daughters by the marriage, he may redeem himself and wife, by paying her *jujur*; but if there are daughters before they become emancipated, the difficulty is enhanced, because the family are likewise entitled to their value. It is common, however, when they are upon good terms, to release him, on the payment of one *jujur*, or at most with the addition of an *adat* of fifty dollars. With this addition, he may insist upon a release, whilst his daughters are not marriageable. If the family have paid any debts for him, he must also make them good. Should he contract more than they approve of, and they fear his adding to them, they procure a divorce, and send him back to his parents; but must pay his debts to that time. If he is a notorious spendthrift, they outlaw him, by means of a writ presented to the magistrate. These are inscribed on slips of bamboo with a sharp instrument, and I have several of them in my possession. They must banish him from home, and if they receive him again, or assist him with the smallest sum, they are liable to all his debts. On the prodigal son’s return, and assurance of amendment, this writ may be redeemed, on payment of five dollars to the *proatlins*, and satisfying the creditors. This kind of marriage is productive of much confusion, for till the time it takes place, the young man belongs to one *dusun* and family, and afterwards to another, and as they have no records to refer to, there is great uncertainty in settling the time when debts were contracted, and the like. Sometimes the redemption of the family, and their return to the former *dusun*, take place in the second or third generation; and in many cases it is doubtful whether they ever took place or not; the two parties contradicting each other, and, perhaps, no evidence to refer to. Hence arise various and intricate *bechars*.

Besides the modes of marriage above described, a third form, called *semandro*, has been adopted from the Malays, and thence termed *semandro malayo* or *mardika* (free). This marriage is a regular treaty between the parties, on the footing of equality. The *adat* paid to the girl’s friends...
friends has usually been twelve dollars. The agreement stipulates, that all effects, gains, or earnings, are to be equally the property of both, and, in case of divorce by mutual consent, the stock, debts, and credits, are to be equally divided. If the man only insists on the divorce, he gives the woman her half of the effects, and loses the twelve dollars he has paid. If the woman only claims the divorce, she forfeits her right to the proportion of the effects, but is entitled to keep her tikar, bantal, and dandan (paraphernalia), and her relations are liable to pay back the twelve dollars; but it is seldom demanded. This mode, doubtless the most conformable to our ideas of conjugal right and felicity, is that which the chiefs of the Rejang country have formally consented to establish throughout their jurisdiction, and to their orders the influence of the Malayan priests will contribute to give efficacy.

In the ambel anak marriage, according to the institutions of Passum-mah, when the father resolves to dismiss the husband of his daughter, and send him back to his dusun, the sum for which he can redeem his wife and family is an hundred dollars; and if he can raise that, and the woman is willing to go with him, the father cannot refuse them; and now the affair is changed into a kulo marriage; the man returns to his former tungguan (settlement or family), and becomes of more consequence in society. These people are no strangers to that sentiment which we call a regard to family. There are some families among them more esteemed than others, though not graced with any title or employment in the state. The origin of this distinction it is difficult to trace; but it may have arisen from a succession of men of abilities, or from the reputation for wisdom or valour of some ancestor. Every one has a regard to his race; and the probability of its being extinct is esteemed a great unhappiness. This is what they call tungguan putus, and the expression is used by the lowest member of the community. To have a wife, a family, collateral relations, and a settled place of residence, is to have a tungguan, and this they are anxious to support and perpetuate. It is with this view, that when a single female only remains of a family, they marry her by ambel anak; in which mode the husband’s consequence is lost in the wife’s, and in her children the tungguan of her father
father is continued. They find her a husband that will *menegga tuṅg-guan*, or, as it is expressed amongst the Rejangs *menegga rumah*, set up the house again.

The *semando* marriage is little known in *Passummah*. I recollect that a *paṅgeran* of Manna having lost a son by a marriage of this kind with a Malay woman, she refused, upon the father's death, to let the boy succeed to his dignities, and at the same time become answerable for his debts, and carried him with her from the country; which was productive of much confusion. The regulations there in respect to incontinence have much severity, and fall particularly hard on the girl's father, who not only has his daughter spoiled, but must also pay largely for her frailty. To the northward, the offence is not punished with so much rigour, yet the instances are there said to be rarer, and marriage is more usually the consequence. In other respects, the customs of *Passummah* and *Rejang* are the same in these matters.

The rites of marriage, *nikah*, (from the Arabian) consist simply in joining the hands of the parties, and pronouncing them man and wife, without much ceremony, excepting the entertainment which is given on the occasion. This is performed by one of the fathers, or the chief of the *dusun*, according to the original customs of the country; but where Mahometanism has found its way, a priest or *imām* executes the business.

But little apparent courtship precedes their marriages. Their manners do not admit of it: the *bujang* and *gadis* (youth of each sex) being carefully kept asunder, and the latter seldom trusted from under the wing of their mothers. Besides, courtship, with us, includes the idea of humble entreaty on the man's side, and favour and condescension on the part of the woman, who bestow person and property for love. The Sumatran, on the contrary, when he fixes his choice, and pays all that he is worth, for the object of it, may naturally consider the obligation on his side. But still, they are not without gallantry. They preserve a degree of delicacy and respect towards the sex, which might justify their
retorting on many of the polished nations of antiquity, the epithet of barbarians. The opportunities which the young people have, of seeing and conversing with each other, are at the bimbangs, or public festivals, held at the balei, or town-hall of the dusun. On these occasions, the unmarried people meet together, and dance and sing in company. It may be supposed that the young ladies cannot be long without their particular admirers. The men, when determined in their regards, generally employ an old woman as their agent, by whom they make known their sentiments, and send presents to the female of their choice. The parents then interfere, and the preliminaries being settled, a bimbang takes place. At these festivals, a goat, a buffalo, or several, according to the rank of the parties, are killed, to entertain, not only the relations and invited guests, but all the inhabitants of the neighbouring country who chuse to repair to them. The greater the concourse, the more is the credit of the host, who is generally, on these occasions, the father of the girl; but the different branches of the family, and frequently all the people of the dusun, contribute a quota of rice.

The young women proceed in a body to the upper end of the balei, where there is a part divided off for them, by a curtain. The floor is spread with their best mats, and the sides and ceiling of that extremity of the building are hung with pieces of chintz, palampores, and the like. They do not always make their appearance before dinner; that time, with part of the afternoon, previous to a second or third meal, being appropriated to cock-fighting, and other diversions peculiar to the men. Whilst the young are thus employed, the old men consult together upon any affair that may be at the time in agitation; such as repairing a public building, or making reprisals upon the cattle of a neighbouring people. The bimbangs are often given on occasions of business only, and as they are apt to be productive of cabals, the Europeans require that they shall not be held without their knowledge and approbation. To give authority to their contracts and other deeds, whether of a public or private nature, they always make one of these feasts. Writings, say they, may be altered or counterfeited, but the memory of what is transacted and concluded in the presence of a thousand witnesses, must
must remain sacred. Sometimes, in token of the final determination of an affair, they cut a notch in a post, before the chiefs; which they call tako kayu.

In the evening their softer amusements take place; of which the dances are the principal. These are performed either singly, or by two women, two men, or with both mixed. Their motions and attitudes are usually slow, and too much forced to be graceful; approaching often to the lascivious, and not unfrequently the ludicrous. This is, I believe, the general opinion formed of them by Europeans, but it may be the effect of prejudice. Certain I am, that our usual dances are, in their judgment, to the full as ridiculous. The minuets they compare to the fighting of two game-cocks, alternately approaching and receding. Our country-dances they esteem too violent and confused, without shewing grace or agility. The stage dances, I have not a doubt, would please them. Part of the female dress, called the salendang, which is usually of silk, with a gold head, is tied round the waist, and the ends of this, they, at times, extend behind them with their hands. They bend forward as they dance, and usually carry a fan, which they close and strike smartly against their elbows, at particular cadences. They keep time well, and the partners preserve a consistency with each other, though the figure and steps are ad libitum. A brisker movement is sometimes adopted, which proves more conformable to the taste of the English spectators.

Dancing is not the only amusement on these occasions. A gadis sometimes rises, and leaning her face on her arm, supporting herself against a pillar, or the shoulder of one of her companions, with her back to the audience, begins a tender song. She is soon taken up, and answered, by one of the bujangs in company, whose greatest pretensions to gallantry and fashion are founded on an adroitness at this polite accomplishment. The uniform subject, on such occasions, is love, and as the words are extempore, there are numberless degrees of merit in the composition, which is sometimes surprisingly well turned, quaint, and even witty. Professed story-tellers are sometimes introduced, who are raised on a little stage, and during several hours arrest the attention of their audience,
audience, by the relation of wonderful and interesting adventures. There are also characters of humour amongst them, who, by buffoonery, mimicry, punning, repartee, and satire, (rather of the Sardonic kind) are able to keep the company in laughter, at intervals, during the course of a night’s entertainment. The assembly seldom breaks up before daylight, and these bimbangs are often continued for several days and nights together, till their stock of provisions is exhausted. The young men frequent them in order to look out for wives, and the lasses of course set themselves off to the best advantage. They wear their best silken dresses, of their own weaving; as many ornaments of filigree as they possess; silver rings upon their arms and legs; and earrings of a particular construction. Their hair is variously adorned with flowers, and perfumed with oil of benzoin. Civet is also in repute, but more used by the men. To render their skin fine, smooth, and soft, they make use of a white cosmetic, called pupur. The mode of preparing it is as follows. The basis is fine rice, which is a long time steeped in water, and let to ferment, during which process the water becomes of a deep red colour, and highly putrid, when it is drained off, and fresh added successively until the water remains clear, and the rice subsides in the form of a fine, white paste. It is then exposed to the sun to dry, and being reduced to a powder, they mix with it ginger, the leaves of a plant called by them dilam, and by Europeans patch-leaf (melissa lotoria, R.), which gives to it a peculiar smell, and also, as is supposed, a cooling quality. They add likewise the flowers of the jagong (maiz); kayu chendana (sandal wood); and the seeds of a plant called there kapus antu (fairy-cotton), which is the hibiscus abelmoschus, or musk seed. All these ingredients, after being moistened and well mixed together, are made up into little balls, and when they would apply the cosmetic, these are diluted with a drop of water, rubbed between the hands, and then on the face, neck, and shoulders. They have an apprehension, probably well founded, that a too abundant or frequent application, will, by stopping the pores of the skin, bring on a fever. It is used, with good effect, to remove that troublesome complaint, so well known to Europeans in India, by the name of the prickly heat; but it is not always safe for strangers thus to check the operations of nature in a warm climate. The Sumatran girls, as well as our English maidens, entertain a favourable opinion of
the virtues of morning dew, as a beautifier, and believe that by rubbing it to the roots of the hair, it will strengthen and thicken it. With this view they take pains to catch it before sun-rise, in vessels, as it falls.

If a wedding is the occasion of the bimbang, the couple are married, perhaps, the second or third day; but it may be two or three more, ere the husband can get possession of his bride; the old matrons making it a rule to prevent him, as long as possible, and the bride herself holding it a point of honour, to defend to extremity that jewel, which she would yet be disappointed in preserving. They sit up in state, at night, on raised cushions, in their best clothes and trinkets. They are sometimes loaded on the occasion, with all the finery of their relations, or even the whole dusun; and carefully eased of it when the ceremony is over. But this is not the case with the children of persons of rank. I remember being present at the marriage of a young woman, whose beauty would not have disgraced any country, with a son of Raddin, prince of Madura, to whom the English gave protection from the power of the Dutch, after his father had fallen a sacrifice. She was decked in unborrowed plumes. Her dress was eminently calculated to do justice to a fine person; her hair, in which consists their chief pride, was disposed with extreme grace; and an uncommon elegance and taste were displayed in the workmanship and adjustment of her ornaments. It must be

* It is recorded, that the jealousy between the English and Dutch at Bantam, arose from a preference shewn to the former by the king, at a festival which he gave upon obtaining a victory of this nature, which his bride had long disputed with him. For a description of a Malayan wedding, with an excellent plate representing the conclusion of the ceremony and the sleeping apartment, I beg to refer the reader to Captain Forrest's Voyage to New Guinea, p. 286, 4to. edit. The bed-place is described at p. 232, and the processional car (per-arakun) at p. 241. His whole account of the domestic manners of the people of Mindanau, at the court of which he lived on terms of familiarity, will be found highly amusing.

b The circumstances of this disgraceful affair are preserved in a book, entitled "A Voyage to the East Indies in 1747 and 1748." This Raddin Taman̄ggung, a most intelligent and respectable man, died at Bencoolen in the year 1790. His sons possess the good qualities of their father, and are employed in the Company's service.
be confessed, however, that this taste is by no means general, especially amongst the country people. Simplicity, so essential to the idea, is the characteristic of a rude and quite uncivilized people; and is again adopted by men in their highest state of refinement. The Sumatrans stand removed from both these extremes. Rich and splendid articles of dress and furniture, though not often procured, are the objects of their vanity and ambition.

The bimbangs are conducted with great decorum and regularity. The old women are very attentive to the conduct of the girls, and the male relations are highly jealous of any insults that may be shewn them. A lad, at one of these entertainments, asked another his opinion of a gadis who was then dancing. "If she was plated with gold," replied he, "I would not take her for my concubine, much less for my wife." A brother of the girl happened to be within hearing, and called him to account for the reflection thrown on his sister. Krises were drawn, but the bystanders prevented mischief. The brother appeared the next day, to take the law of the defamer, but the gentleman, being of the risau description, had absconded, and was not to be found.

The customs of the Sumatrans permit their having as many wives by jujur, as they can compass the purchase of, or afford to maintain; but it is extremely rare that an instance occurs of their having more than one, and that only among a few of the chiefs. This continence they in some measure owe to their poverty. The dictates of frugality are more powerful with them, than the irregular calls of appetite, and make them decline an indulgence, that their law does not restrain them from. In talking of polygamy, they allow it to be the privilege of the rich, but regard it as a refinement which the poor Rejangs cannot pretend to. Some young risaus have been known to take wives in different places, but the father of the first, as soon as he hears of the second marriage, procures a divorce. A man married by semando cannot take a second wife, without repudiating the first, for this obvious reason, that two or more persons could not be equally entitled to the half of his effects.

Montesquieu
Montesquieu infers, that the law which permits polygamy is physically conformable to the climate of Asia. The season of female beauty precedes that of their reason, and from its prematurity soon decays. The empire of their charms is short. It is therefore natural, the president observes, that a man should leave one wife to take another: that he should seek a renovation of those charms which had withered in his possession. But are these the real circumstances of polygamy? Surely not. It implies the cotemporary enjoyment of women in the same predicament; and I should consider it as a vice, that has its source in the influence of a warm atmosphere upon the passions of men, which, like the cravings of other disordered appetites, make them miscalculate their wants. It is, probably, the same influence, on less rigid nerves, that renders their thirst of revenge so much more violent, than among northern nations; but we are not, therefore, to pronounce murder to be physically conformable to a southern climate. Far be it from my intention, however, to put these passions on a level; I only mean to shew, that the president's reasoning proves too much. It must further be considered, that the genial warmth, which expands the desires of the men, and prompts a more unlimited exertion of their faculties, does not inspire their constitutions with proportionate vigour; but, on the contrary, renders them, in this respect, inferior to the inhabitants of the temperate zone; whilst it equally influences the desires of the opposite sex, without being found to diminish from their capacity of enjoyment. From which I would draw this conclusion, that if nature intended that one woman only should be the companion of one man, in the colder regions of the earth, it appears also intended, a fortiori, that the same law should be observed in the hotter; inferring nature's design, not from the desires, but from the abilities with which she has endowed mankind.

Montesquieu has further suggested, that the inequality in the comparative numbers of each sex born in Asia, which is represented to be greatly superior on the female side, may have a relation to the law that allows polygamy. But there is strong reason to deny the reality of this supposed excess. The Japanese account, taken from Kämpfer, which makes them to be in the proportion of twenty-two to eighteen, is very inconclusive,
inconclusive, as the numbering of the inhabitants of a great city can furnish no propertest; and the account of births at Bantam, which states the number of girls to be ten to one boy, is not only manifestly absurd, but positively false. I can take upon me to assert, that the proportion of the sexes, throughout Sumatra, does not sensibly differ from that ascertained in Europe; nor could I ever learn from the inhabitants of the many eastern islands whom I have conversed with, that they were conscious of any disproportion in this respect.

But from whatever source we derive polygamy, its prevalence seems to be universally attended with the practice of giving a valuable consideration for the woman, instead of receiving a dowry with her. This is a natural consequence. Where each man endeavours to engross several, the demand for the commodity, as a merchant would express it, is increased, and the price of course enhanced. In Europe, on the contrary, where the demand is small; whether owing to the paucity of males from continual diminution; their coldness of constitution, which suffers them rather to play with the sentimental, than act from the animal passion; their corruption of manners leading them to promiscuous concubinage; or, in fine, the extravagant luxury of the times, which too often renders a family an insupportable burthen:—whatever may be the cause, it becomes necessary, in order to counteract it, and produce an additional incitement to the marriage state, that a premium be given with the females. We find in the history of the earliest ages of the world, that where a plurality of women was allowed of, by law or custom, they were obtained by money or service. The form of marriage by semando, among the Malays, which admits but of one partner, requires no sum to be paid by the husband to the relations of the wife, except a trifle, by way of token, or to defray the expences of the wedding-feast. The circumstance of the rejangs confining themselves to one, and at the same time giving a price for their wives, would seem an exception to the general rule laid down; but this is an accidental, and perhaps temporary restraint, arising, it may be, from the European influence, which tends to make them regular and industrious, but keeps them poor: affords the means of subsistence to all, but the opportunity of acquiring riches to few or none. In their genuine state, war and plunder caused a rapid fluctuation of property; the
little wealth now among them, derived mostly from the India Company's expenditure, circulates through the country in an equal stream, returning chiefly, like the water exhaled in vapours from the sea, to its original source. The custom of giving jujurs had most probably its foundation in polygamy; and the superstructure subsists, though its basis is partly mouldered away; but being scarcely tenable, the inhabitants are inclined to quit, and suffer it to fall to the ground. Moderation in point of women destroying their principle, the jujurs appear to be devoid of policy. Open a new spring of luxury, and polygamy, now confined to a few individuals amongst the chiefs, will spread throughout the people. Beauty will be in high request; each fair one will be sought for by many competitors; and the payment of the jujur be again esteemed a reasonable equivalent for possession. Their acknowledging the custom under the present circumstances to be a prejudicial one, so contrary to the spirit of eastern manners, which is ever marked with a blind veneration for the establishments of antiquity, contributes to strengthen considerably the opinion I have advanced.

Through every rank of the people there prevails a strong spirit of gaming, which is a vice that readily insinuates itself into minds naturally indisposed to the avocations of industry; and being in general a sedentary occupation, is more adapted to a warm climate, where bodily exertion is in few instances considered as an amusement. Beside the common species of gambling with dice, which, from the term dadu applied to it, was evidently introduced by the Portuguese, they have several others; as the judi, a mode of playing with small shells, which are taken up by handfuls, and being counted out by a given number at a time (generally that of the party engaged), the success is determined by the fractional number remaining, the amount of which is previously guessed at by each of the party. They have also various games on chequered boards or other delineations, and persons of superior rank are in general versed in the game of chess, which they term main gājah, or the game of the elephant, naming the pieces as follows: king, raja; queen or vizir, mantri; bishop or elephant, gājah; knight or horse, kuda; castle, rook, or chariot, tēr; and pawn or foot-soldier, bidak. For check! they use the word sah; and for check-mate, māt or matī. Among these names,
names, the only one that appears to require observation, as being peculiar, is that for the castle or rook, which they have borrowed from the Tamul language of the peninsula of India, wherein the word lèr (answering to the Sanskrit rat'ha) signifies a chariot, (particularly such as are drawn in the processions of certain divinities), and not unaptly transferred to this military game, to complete the constituent parts of an army. Gambling, especially with dice, is rigorously forbidden throughout the pepper districts, because it is not only the child, but the parent of idleness, and by the events of play often throws whole villages into confusion. Debts contracted on this account are declared to be void.

Cock-fighting. To cock-fighting they are still more passionately addicted, and it is indulged to them under certain regulations. Where they are perfectly independent, their propensity to it is so great, that it resembles rather a serious occupation, than a sport. You seldom meet a man travelling in the country, without a cock under his arm, and sometimes fifty persons in a company, when there is a bimbang in one of the neighbouring villages. A country-man coming down, on any occasion, to the bazar, or settlement at the mouth of the river, if he boasts the least degree of spirit, must not be unprovided with this token of it. They often game high at their meetings; particularly when a superstitious faith in the invincibility of their bird has been strengthened by past success. An hundred Spanish dollars is no very uncommon risk, and instances have occurred of a father’s staking his children or wife, and a son his mother or sisters, on the issue of a battle; when a run of ill luck has stripped them of property, and rendered them desperate. Quarrels, attended with dreadful consequences, have often arisen on these occasions.

Rules of cocking. By their customs, there are four umpires appointed to determine on all disputed points in the course of the battles; and from their decision there lies no appeal; except the Gothic appeal to the sword. A person who loses, and has not the ability to pay, is immediately proscribed, departs with disgrace, and is never again suffered to appear at the galangang. This cannot with propriety be translated, a cock-pit, as it is generally a spot on the level ground, or a stage erected, and covered in. It is inclosed with a railing, which keeps off the spectators; none but the handlers
handlers and heelers being admitted within side. A man who has an high opinion of, and regard for his cock, will not fight him under a certain number of dollars, which he places in order on the floor: his poorer adversary is perhaps unable to deposit above one half: the standers-by make up the sum, and receive their dividends in proportion, if successful. A father, at his death-bed, has been known to desire his son to take the first opportunity of matching a certain cock, for a sum equal to his whole property, under a blind conviction of its being betuah, or invulnerable.

Cocks of the same colour are never matched, but a grey against a pile, a yellow against a red, or the like. This might have been originally designed to prevent disputes, or knavish impositions. The Malay breed of cocks is much esteemed by connoisseurs who have had an opportunity of trying them. Great pains is taken in the rearing and feeding; they are frequently handled, and accustomed to spar in public, in order to prevent any shyness. Contrary to our laws, the owner is allowed to take up and handle his cock during the battle, to clear his eye of a feather, or his mouth of blood. When a cock is killed, or runs, the other must have sufficient spirit and vigour left to peck at him three times, on his being held to him for that purpose, or it becomes a drawn battle; and sometimes an experienced cocker will place the head of his vanquished bird, in such an uncouth posture, as to terrify the other, and render him unable to give this proof of victory. The cocks are never trimmed, but matched in full feather. The artificial spur used in Sumatra, resembles in shape the blade of a scimitar, and proves a more destructive weapon than the European spur. It has no socket, but is tied to the leg, and in the position of it, the nicety of the match is regulated. As in horse-racing, weight is proportioned to inches, so in cocking, a bird of superior weight and size is brought to an equality with his adversary, by fixing the steel spur so many scales of the leg above the natural spur, and thus obliging him to fight with a degree of disadvantage. It rarely happens that both cocks survive the combat.

In the northern parts of the island, where gold-dust is the common medium of gambling, as well as of trade, so much is accidentally dropt
in weighing and delivering, that at some cock pits, where the resort of people is great, the sweepings are said, probably with exaggeration, to be worth upwards of a thousand dollars per annum to the owner of the ground; beside his profit of two fanams (five-pence) for each battle.

Quail-fighting. In some places they match quails, in the manner of cocks. These fight with great inveteracy, and endeavour to seize each other by the tongue. The Achinese bring also into combat the dial bird (murei) which resembles a small magpie, but has an agreeable, though imperfect note. They sometimes engage one another on the wing, and drop to the ground in the struggle.

Fencing. They have other diversions of a more innocent nature. Matches of fencing, or a species of tournament, are exhibited on particular days; as at the breaking up of their annual fast, or month of ramadan, called there the puasa. On these occasions they practise strange attitudes, with violent contorsions of the body, and often work themselves up to a degree of frenzy; when the old men step in, and carry them off. These exercises, in some circumstances, resemble the idea which the ancients have given us of the pyrrhic or war dance; the combatants moving at a distance from each other, in cadence, and making many turns and springs, unnecessary in the representation of a real combat. This entertainment is more common among the Malays, than in the country. The chief weapons of offence used by these people, are the kujur or lance, and the kris. This last is properly Malayan, but in all parts of the island, they have a weapon equivalent, though in general less curious in its structure, wanting that waving in the blade, for which the kris is remarkable, and approaching nearer to daggers or knives.

Among their exercises we never observe jumping or running. They smile at the Europeans, who, in their excursions, take so many unnecessary leaps. The custom of going barefoot, may be a principal impediment to this practice, in a country overrun with thorny shrubs, and where no fences occur to render it a matter of expediency.

They have a diversion similar to that described by Homer, as practised
tised among the Phæacians, which consists in tossing an elastic wicker ball, or round basket of split rattans, into the air, and from one player to another, in a peculiar manner. This game is called by the Malays *sipak raga*, or in the dialect of Bencoolen, *chipak rago*, and is played by a large party standing in an extended circle, who endeavour to keep up the ball, by striking it either perpendicularly, in order to receive it again, or obliquely to some other person of the company, with the foot or the hand, the heel or the toe, the knee, the shoulder, the head, or with any other part of the body; the merit appearing to consist in producing the effect in the least obvious or most whimsical manner; and in this sport many of them attain an extraordinary degree of expertness. Among the plates of Lord Macartney's Embassy will be found the representation of a similar game, as practised by the natives of Cochin-china.

The Sumatrans, and more particularly the Malays, are much attached, in common with many other eastern people, to the custom of smoking *opium*. The poppy which produces it not growing on the island, it is annually imported from Bengal in considerable quantities, in chests containing an hundred and forty pounds each. It is made up in cakes of five or six pounds weight, and packed with dried leaves; in which situation it will continue good and vendible for two years, but after that period grows hard, and diminishes considerably in value. It is of a darker colour, and is supposed to have less strength than the Turkey opium. About an hundred and fifty chests are consumed annually on the West coast of Sumatra; where it is purchased, on an average, at three hundred dollars the chest, and sold again, in smaller quantities, at five or six. But, on occasions of extraordinary scarcity, I have known it to sell for its weight in silver, and a single chest to fetch upwards of three thousand dollars.

The method of preparing it for use is as follows. The raw opium is first boiled or seethed in a copper vessel; then strained through a cloth, to free it from impurities; and then a second time boiled. The leaf of the *tambaku*, shred fine, is mixed with it, in a quantity sufficient to absorb the whole; and it is afterwards made up into small pills, about the size of
of a pea, for smoking. One of these being put into the small tube that projects from the side of the opium pipe, that tube is applied to a lamp, and the pill being lighted, is consumed at one whiff or inflation of the lungs, attended with a whistling noise. The smoke is never emitted by the mouth; but usually receives vent through the nostrils, and sometimes, by adepts, through the passage of the ears and eyes. This preparation of the opium is called maddat, and is often adulterated in the process, by mixing jaggri, or pine sugar, with it; as is the raw opium, by incorporating with it the fruit of the pisang or plantain.

The use of opium among these people, as that of intoxicating liquors among other nations, is a species of luxury which all ranks adopt according to their ability, and which, when once become habitual, it is almost impossible to shake off. Being, however, like other luxuries, expensive, few only, among the lower or middling class of people, can compass the regular enjoyment of it, even where its use is not restrained; as it is among the pepper-planters, to the times of their festivals. That the practice of smoking opium must be in some degree prejudicial to the health, is highly probable; yet I am inclined to think that effects have been attributed to it, much more pernicious to the constitution than it in reality causes. The bugis soldiers, and others in the Malay bazaars, whom we see most attached to it, and who use it to excess, commonly appear emaciated; but they are in other respects abandoned and debauched. The Limun and Batang Assei gold-traders, on the contrary, who are an active, laborious class of men, but yet indulge as freely in opium as any others whatever, are, notwithstanding, the most healthy and vigorous people to be met with on the island. It has been usual also to attribute to the practice, destructive consequences of another nature; from the frenzy it has been supposed to excite in those who take it in quantities. But this should probably rank with the many errours that mankind have been led into, by travellers addicted to the marvellous; and there is every reason to believe, that the furious quarrels, desperate assassinations, and sanguinary attacks, which the use of opium is said to give birth to, are idle notions, originally adopted through ignorance, and since maintained, from the mere want of investigation, without having any solid foundation. It is not to be controverted, that those desperate acts of indiscriminate
discriminate murder, called by us, mucks, and by the natives, mengamok, do actually take place, and frequently too, in some parts of the East (in Java in particular) but it is not equally evident that they proceed from any intoxication, except that of their unruly passions. Too often they are occasioned by excess of cruelty and injustice in their oppressors. On the West coast of Sumatra about twenty thousand pounds weight of this drug are consumed annually, yet instances of this crime do not happen, (at least within the scope of our knowledge) above once in two or three years. During my residence there I had an opportunity of being an eye-witness but to one muck. The slave of a Portuguese woman, a man of the island of Nias, who in all probability had never handled an opium pipe in his life, being treated by his mistress with extreme severity, for a trifling offence, vowed he would have revenge if she attempted to strike him again; and ran down the steps of the house, with a knife in each hand, as it is said. She cried out, mengamok! The civil guard was called, who having the power, in these cases, of exercising summary justice, fired half a dozen rounds into an outhouse where the unfortunate wretch had sheltered himself on their approach; and from whence he was at length dragged, covered with wounds. Many other mucks might perhaps be found, upon scrutiny, of the nature of the foregoing, where a man of strong feelings was driven, by excess of injury, to domestic rebellion.

It is true that the Malays, when in a state of war they are bent on any daring enterprise, fortify themselves with a few whiffs of opium, to render them insensible to danger; as the people of another nation are said to take a dram for the same purpose; but it must be observed, that the resolution for the act precedes, and is not the effect of the intoxication. They take the same precaution, previous to being led to public execution; but on these occasions shew greater signs of stupidity than frenzy. Upon the whole, it may be reasonably concluded, that the sanguinary achievements, for which the Malays have been famous, or infamous rather, in history, are more justly to be attributed to the natural ferocity of their disposition, or to the influence upon their manners of a particular state of society, than to the qualities of any drug whatever. The pretext of the soldiers of the country-guard for using opium is, that
that it may render them watchful on their nightly posts: we, on the contrary, administer it to procure sleep; and according to the quantity it has either effect. The delirium it produces is known to be so very pleasing, that Pope has supposed this to have been designed by Homer, when he describes the delicious draught prepared by Helen, called nepenthe, which exhilarated the spirits, and banished from the mind the recollection of woe.

It is remarkable that at Batavia, where the assassins just now described, when taken alive, are broken on the wheel, with every aggravation of punishment that the most rigorous justice can inflict, the mucks yet happen in great frequency; whilst at Bencoolen, where they are executed in the most simple and expeditious manner, the offence is extremely rare. Excesses of severity in punishment may deter men from deliberate and interested acts of villany, but they add fuel to the atrocious enthusiasm of desperadoes. A further proof of the influence that mild government has upon the manners of people, is, that the piratical adventures, so common on the eastern coast of the island, are unknown on the western. Far from our having apprehensions of the Malays, the guards at the smaller English settlements are almost entirely composed of them, with a mixture of Bugis or Makasar people. Europeans, attended by Malays only, are continually travelling through the country. They are the only persons employed in carrying treasure to distant places; in the capacity of secretaries for the country correspondence; as civil officers, in seizing delinquents, among the planters, and elsewhere; and as masters and supercargoes of the tambangans, praws, and other small coasting vessels. So great is the effect of moral causes and habit, upon a physical character esteemed the most treacherous and sanguinary.

Whether to blunt the edge of painful reflection, or owing to an aversion our natures have to total inaction, most nations have been addicted to the practice of enjoying by mastication, or otherwise, the flavour of substances possessing an inebriating quality. The South Americans chew the cocoa and mambee, and the eastern people, the betel and areca, or, as they are called in the Malay language, sirih and pinang. This custom has been accurately described by various writers, and therefore it is almost superfluous to say more on the subject, than that the Sumatrans universally use it; carry the ingredients constantly about them; and serve it to their guests on all occasions; the prince in a gold stand, and the poor man in a brass box, or mat bag. The betel-stands of the better rank of people are usually of silver, embossed with rude figures. The Sultan of Moco-moco was presented with one by the India Company, with their arms on it; and he possesses beside, another of gold filagree. The form of the stand is the frustum of an hexagonal pyramid, reversed; about six or eight inches in diameter. It contains many smaller vessels, fitted to the angles, for holding the nut, leaf, and chunam, which is quick lime made from calcined shells; with places for the instruments (kachip) employed in cutting the first, and spatulas for spreading the last.

When the first salutation is over, which consists in bending the body, and the inferior’s putting his joined hands between those of the superior, and then lifting them to his forehead, the betel is presented as a token of hospitality, and an act of politeness. To omit it on the one hand, or to reject it on the other, would be an affront; as it would be likewise, in a person of subordinate rank, to address a great man without the precaution of chewing it before he spoke. All the preparation consists in spreading
spreading on the sirih leaf, a small quantity of the chunam, and folding it up with a slice of the pinang nut. Some mix with these, gambir, which is a substance prepared from the leaves of a tree of that name, by boiling their juices to a consistence, and made up into little balls or squares, as before spoken of: tobacco is likewise added, which is shred fine for the purpose, and carried between the lip and upper row of teeth. From the mastication of the first three, proceeds a juice which tinges the saliva of a bright red, and which the leaf and nut, without the chunam, will not yield. This hue being communicated to the mouth and lips is esteemed ornamental; and an agreeable flavour is imparted to the breath. The juice is usually, (after the first fermentation produced by the lime) though not always, swallowed by the chewers of betel. We might reasonably suppose that its active qualities would injure the coats of the stomach, but experience seems to disprove such a consequence. It is common to see the teeth of elderly persons stand loose in the gums, which is probably the effect of this custom, but I do not think that it affects the soundness of the teeth themselves. Children begin to chew betel very young, and yet their teeth are always beautifully white, till pains are taken to disfigure them, by filing, and staining them black. To persons who are not habituated to the composition, it causes a strong giddiness, astringes and excoriates the tongue and fauces, and deadens for a time the faculty of taste. During the puasa, or fast of ramadan, the Mahometans among them abstain from the use of betel, whilst the sun continues above the horizon; but excepting at this season, it is the constant luxury of both sexes, from an early period of childhood, till, becoming toothless, they are reduced to the necessity of having the ingredients previously reduced to a paste for them, that without further effort the betel may dissolve in the mouth. Along with the betel, and generally in the chunam, is the mode of conveying philtres, or love charms. How far they prove effectual I cannot take upon me to say, but suppose that they are of the nature of our stimulant medicines, and that the direction of the passion is of course indiscriminate. The practice of administering poison in this manner is not followed in latter times; but that the idea is not so far eradicated, as entirely to prevent suspicion, appears from this circumstance; that the guest, though taking a leaf from the betel-service of his entertainer, not unfrequently applies to it his own chunam, and never
never omits to pass the former between his thumb and fore finger, in order to wipe off any extraneous matter. This mistrustful procedure is so common as not to give offence.

Beside the mode beforementioned of enjoying the flavour of tobacco, it is also smoked by the natives and for this use, after shredding it fine, whilst green, and drying it well, it is rolled up in the thin leaves of a tree, and is in that form called roko, a word they appear to have borrowed from the Dutch. The rokos are carried in the betel-box, or more commonly under the destar or handkerchief which, in imitation of a turband, surrounds the head. Much tobacco is likewise imported from China, and sells at a high price. It seems to possess a greater pungency than the Sumatran plant, which the people cultivate for their own use, in the interior parts of the island.

The custom of sending emblematical presents, in order to make known, in a covert manner, the birth, progress, or change of certain affections of the mind, prevails here, as in some other parts of the East; and not only flowers of various kinds have their appropriate meaning, but also cayenne-pepper, betel-leaf, salt, and other articles, are understood by adepts to denote love, jealousy, resentment, hatred, and other strong feelings.

The Sumatrans in general are good speakers. The gift of oratory seems natural to them. I knew many among them, whose harangues I have listened to with pleasure and admiration. This may be accounted for, perhaps, from the constitution of their government, which being far removed from despotism, seems to admit, in some degree, every member of the society to a share in the public deliberations. Where personal endowments, as has been observed, will often raise a private man to a share of importance in the community, superior to that of a nominal chief, there is abundant inducement for the acquisition of these valuable talents. The forms of their judicial proceedings, likewise, where there are no established advocates, and each man depends upon his own, or his friend's abilities, for the management of his cause, must doubtless contribute to this habitual eloquence. We may add to these
SUMATRA.

conjectures, the nature of their domestic manners, which introduce the sons, at an early period of life, into the business of the family, and the counsels of their elders. There is little to be perceived among them, of that passion for childish sports which marks the character of our boys, from the seventh to the fourteenth year. In Sumatra you may observe infants, not exceeding the former age, full dressed, and armed with a kris, seated in the circle of the old men of the dusun, and attending to their debates with a gravity of countenance not surpassed by their grandfathers. Thus initiated, they are qualified to deliver an opinion in public, at a time of life when an English schoolboy could scarcely return an answer to a question beyond the limits of his grammar or syntax, which he has learned by rote. It is not a little unaccountable, that this people, who hold the art of speaking in such high esteem, and evidently pique themselves on the attainment of it, should yet take so much pains to destroy the organs of speech, in filing down, and otherwise disfiguring their teeth; and likewise adopt the uncouth practice of filling their mouths with betel, whenever they prepare to hold forth. We must conclude, that it is not upon the graces of elocution they value an orator, but his artful and judicious management of the subject matter; together with a copiousness of phrase, a perspicuity of thought, an advantageous arrangement, and a readiness, especially, at unravelling the difficulties and intricacies of their suits.

Child-bearing. The curse entailed on women in the article of child-bearing does not fall so heavy in this as in the northern countries. Their pregnancy, scarcely at any period prevents their attendance on the ordinary domestic duties; and usually within a few hours after their delivery they walk to the bathing-place, at a small distance from the house. The presence of a sage femme is often esteemed superfluous. The facility of parturition may probably be owing to the relaxation of the frame, from the warmth of the climate; to which cause also, may be attributed the paucity of children borne by the Sumatran women, and the early decay of their beauty and strength. They have the tokens of old age, at a season of life when European women have not passed their prime. They are like the fruits of the country, soon ripe, and soon decayed. They bear children before fifteen, are generally past it at thirty, and grey-headed and
and shrivelled at forty. I do not recollect hearing of any woman who had six children, except the wife of Raddin of Madura, who had more; and she, contrary to the universal custom, did not give suck to hers.

Mothers carry the children, not on the arm, as our nurses do, but straddling on the hip, and usually supported by a cloth, which ties in a knot on the opposite shoulder. This practice, I have been told, is common in some parts of Wales. It is much safer than the other method, less tiresome to the nurse, and the child has the advantage of sitting in a less constrained posture: but the defensive armour of stays, and offensive weapons called pins, might be some objection to the general introduction of the fashion in England. The children are nursed but little; not confined by any swathing or bandages; and being suffered to roll about the floor, soon learn to walk and shift for themselves. When cradles are used, they are swung suspended from the ceiling of the rooms.

The country people can very seldom give an account of their age, being entirely without any species of chronology. Among those country people who profess themselves Mahometans, to very few is the date of the *Hejra* known; and even of those who in their writings make use of it, not one in ten can pronounce in what year of it he was born. After a few *taun padi* (harvests) are elapsed, they are bewildered in regard to the date of an event, and only guess at it from some contemporaneous circumstance of notoriety; as the appointment of a particular *dupati*; the incursion of a certain enemy, or the like. As far as can be judged from observation, it would seem, that not a great proportion of the men attain to the age of fifty, and sixty years is accounted a long life.

The children among the *Rejangs* have generally a name given to them by their parents soon after their birth, which is called "namo daging." The *galar* (cognomen), another species of name, or title, as we improperly translate it, is bestowed at a subsequent, but not at any determinate, period: sometimes, as the lads rise to manhood, at an entertainment given by
by the parent, on some particular occasion; and often at their marriage. It is generally conferred by the old men of the neighbouring villages, when assembled; but instances occur of its being, irregularly, assumed by the persons themselves; and some never obtain any galar. It is also not unusual, at a convention held on business of importance, to change the galar of one or two of the principal personages, to others of superior estimation; though it is not easy to discover in what this pre-eminence consists, the appellations being entirely arbitrary, at the fancy of those who confer them: perhaps in the loftier sound, or more pompous allusion in the sense, which latter is sometimes carried to an extraordinary pitch of bombast, as in the instance of "Penígunchang bumi," or "Shaker of the world," the title of a panígeran of Manna. But a climax is not always perceptible in the change.

The father, in many parts of the country, particularly in Passum-mah, is distinguished by the name of his first child, as "Pa-Ladin," or "Pa-Rindu," (Pa for bapa, signifying "the father of") and loses in this acquired, his own proper name. This is a singular custom, and surely less conformable to the order of nature, than that which names the son from the father. There, it is not usual to give them a galar on their marriage, as with the Rejangs, among whom the filionymic is not so common, though sometimes adopted, and occasionally joined with the galar; as Radin-pa-Chirano. The women never change the name given them at the time of their birth; yet frequently they are called, through courtesy, from their eldest child, "Ma si ano," the mother of such an one; but rather as a polite description, than a name. The word or particle "Si" is prefixed to the birth-names of persons, which almost ever consist of but a single word, as Si Bintang, Si Tolong, and we find from Captain Forrest's voyage, that in the island of Mindanau, the infant son of the Raja Muda was named Se Mama.

A Sumatran ever scrupulously abstinates from pronouncing his own name; not, as I understand, from any motive of superstition, but merely as a punctilio in manners. It occasions him infinite embarrassment, when a stranger, unacquainted with their customs, requires it of him. As soon as he recovers from his confusion, he solicits the interposition of his
his neighbour. He is never addressed, except in the case of a superior dictating to his dependant, in the second person, but always in the third; using his name or title, instead of the pronoun; and when these are unknown, a general title of respect is substituted, and they say, for instance, "apa orang kaya punia suka," "what is his honour's pleasure" for "what is your, or your honour's pleasure?" When criminals, or other ignominious persons, are spoken to, use is made of the pronoun personal kau (a contraction of anghkau) particularly expressive of contempt. The idea of disrespect annexed to the use of the second person, in discourse, though difficult to be accounted for, seems pretty general in the world. The Europeans, to avoid the supposed indecorum, exchange the singular number for the plural; but I think, with less propriety of effect than the Asiatic mode; if to take off from the bluntness of address be the object aimed at.

The boys are circumcised, where Mahometanism prevails, between the sixth and tenth year. The ceremony is called krat kulop and buang or lepas malu (casting away their shame), and a bimbang is usually given on the occasion; as well as at the ceremony of boring the ears and filing the teeth of their daughters, (before described) which takes place at about the age of ten or twelve; and until this is performed, they cannot, with propriety, be married.

At their funerals, the corpse is carried to the place of interment on a broad plank, which is kept for the public service of the dusun, and lasts for many generations. It is constantly rubbed with lime, either to preserve it from decay, or to keep it pure. No coffin is made use of; the body being simply wrapped in white cloth, particularly of the sort called hummums. In forming the grave, (kubur), after digging to a convenient depth, they make a cavity in the side, at bottom, of sufficient dimensions to contain the body, which is there deposited on its right side. By this mode the earth literally lies light upon it; and the cavity, after strewing flowers in it, they stop up by two boards, fastened angularly to each other, so that the one is on the top of the corpse, whilst the other defends it on the open side; the edge resting on the bottom of the grave. The outer excavation is then filled up with earth;
earth; and little white flags, or streamers, are stuck in order around. They likewise plant a shrub, bearing a white flower, called *kumbang-kamboja* (plumeria obtusa), and in some places, wild marjoram. The women who attend the funeral make a hideous noise, not much unlike the Irish howl. On the third and seventh day, the relations perform a ceremony at the grave, and at the end of twelve months, that of *tegga batu*, or setting up a few long, elliptical stones, at the head and foot; which, being scarce in some parts of the country, bear a considerable price. On this occasion, they kill and feast on a buffalo, and leave the head to decay on the spot, as a token of the honour they have done to the deceased, in eating to his memory.* The ancient burying-places are called *krammat*, and are supposed to have been those of the holy men by whom their ancestors were converted to the faith. They are held in extraordinary reverence, and the least disturbance or violation of the ground, though all traces of the graves be obliterated, is regarded as an unpardonable sacrilege.

Religion. In works descriptive of the manners of people little known to the world, the account of their *religion*, usually constitutes an article of the first importance. Mine will labour under the contrary disadvantage. The ancient and genuine religion of the *Rejangs*, if in fact they ever had any, is scarcely now to be traced; and what principally adds to its obscurity, and the difficulty of getting information on the subject, is, that even those among them who have not been initiated in the principles of Mahometanism, yet regard those who have, as persons advanced a step

* The above ceremonies (with the exception of the last) are briefly described in the following lines, extracted from a Malayan poem.

Setelah sudah de tañgisi, nia
Lalu de kubur de tanamkan 'nia
De ambel koran de ajikan 'nia
Sopaya lepas deri sangsara 'nia
Men¿gaji de kubur tujuh ari
Setelah de khatam tiga kali
Sudah de tegga batu sakali
Membayer utang pada si-mati.
SUMATRA.

a step in knowledge beyond them, and therefore hesitate to own circumstantially, that they remain still unenlightened. Ceremonies are fascinating to mankind, and without comprehending with what views they were instituted, the profanum vulgus naturally give them credit for something mysterious and above their capacities; and accordingly pay them a tribute of respect. With Mahometanism, a more extensive field of knowledge (I speak in comparison) is open to its converts, and some additional notions of science are conveyed. These help to give it importance; though it must be confessed, they are not the most pure tenets of that religion, which have found their way to Sumatra; nor are even the ceremonial parts very scrupulously adhered to. Many who profess to follow it, give themselves not the least concern about its injunctions, or even know what they require. A Malay at Manna upbraided a countryman, with the total ignorance of religion his nation laboured under. “You pay a veneration to the tombs of your ancestors: what foundation have you for supposing that your dead ancestors can lend you assistance?” “It may be true; answered the other; but what foundation have you for expecting assistance from Allah and Mahomet?” “Are you not aware, replied the Malay, that it is written in a Book? Have you not heard of the Korân?” The native of Passummah, with conscious inferiority, submitted to the force of this argument.

If by religion is meant a public or private form of worship, of any kind; and if prayers, processions, meetings, offerings, images, or priests, are any of them necessary to constitute it, I can pronounce that the Rejangs are totally without religion, and cannot, with propriety, be even termed pagans, if that, as I apprehend, conveys the idea of mistaken worship. They neither worship God, devil, nor idol. They are not, however, without superstitious beliefs of many kinds, and have certainly a confused notion, though perhaps derived from their intercourse with other people, of some species of superior beings, who have the power of rendering themselves visible or invisible at pleasure. These they call “orang alüs” “fine, or impalpable beings,” and regard them as possessing the faculty of doing them good or evil; deprecating their wrath, as the sense of present misfortunes, or apprehension of future, prevails in their minds. But when they speak particularly of them, they...
call them by the appellations of "maleikat" and "jin," which are
the angels and evil spirits of the Arabian, and the idea may probably
have been borrowed at the same time with the names. These are the
powers they also refer to in an oath. I have heard a dupati say, "My
grandfather took an oath that he would not demand the jujur of that
woman, and implored a curse on any of his descendants that should
do it: I never have, nor could I without salah kapada maleikat—an
offence against the angels." Thus they say also, "de tolong nabi,
maleikat," "the prophet and angels assisting." This is pure Maho-
metanism.

The clearest proof that they never entertained an idea of Theism,
or the belief of one supreme power, is, that they have no word in their
language to express the person of God, except the "Allah tala" of the
Malays, corrupted by them to "Ulah talo." Yet, when questioned
on the subject, they assert their ancestors' knowledge of a deity, though
their thoughts were never employed about him; but this evidently
means no more than that their forefathers, as well as themselves, had
heard of the Allah of the Mahometans (Allah orang islam).

They use, both in Rejung and Passumnah, the word "dewa," to ex-
press a superior, invisible class of beings; but each country acknow-
ledges it to be of foreign derivation, and they suppose it Javanese. Radin,
of Madura, an island close to Java, who was well conversant with the
religious opinions of most nations, asserted to me, that "dewa" was an
original word of that country for a superior being, which the Javans of
the interior believed in; but with regard to whom they used no ceremo-
nies or forms of worship: that they had some idea of a future life, but
not as a state of retribution; conceiving immortality to be the lot of
rich, rather than of good men. I recollect, that an inhabitant of one

* In the Transactions of the Batavian Society, Vols. I. and III. is to be found a History
of these Dewas of the Javans, translated from an original MS. The mythology is child-
ish and incoherent. The Dutch commentator supposes them to have been a race of
men held sacred, forming a species of Hierarchy, like the government of the Lamas in
Tartary.
of the islands farther eastward observed to me, with great simplicity, that only great men went to the skies; how should poor men find admittance there? The Sumatrans, where untinctured with Mahometanism, do not appear to have any notion of a future state. Their conception of virtue or vice extends no farther than to the immediate effect of actions, to the benefit or prejudice of society, and all such as tend not to either of these ends, are, in their estimation, perfectly indifferent.

Notwithstanding what is asserted of the originality of the word "deva," I cannot help remarking its extreme affinity to the Persian word "div or dive," which signifies "an evil spirit" or "bad genius." Perhaps, long antecedent to the introduction of the faith of the khalifs among the eastern people, this word might have found its way, and been naturalized in the islands; or, perhaps, its progress was in a contrary direction. It has likewise a connexion in sound, with the names used to express a deity, or some degree of superior being, by many other people of this region of the earth. The Battas, inhabitants of the northern end of Sumatra, whom I shall describe hereafter, use the word daibattah or daivattah; the Chingalese of Ceylon, dewiju; the Telingas of India, dai-wundu; the Biajus of Borneo, dewattah; the Papuas of New Guinea, 'wat; and the Pampangos of the Philippines, diuata. It bears likewise an affinity (perhaps accidental) to the deus and deitas of the Romans.*

The superstition which has the strongest influence on the minds of the Sumatrans, and which approaches the nearest to a species of religion, is that which leads them to venerate, almost to the point of worshipping,

2 P 2

Veneration for the manes and tombs of their ancestors.

* At the period when the above was written I was little aware of the intimate connexion, now well understood to have ancientlysubsisted between the Hindus and the various nations beyond the Ganges. The most evident proofs appear of the extensive dissemination both of their language and mythology throughout Sumatra, Java, Balli, (where at this day they are best preserved) and the other eastern islands. To the Sanskrit words deva and devata, signifying divinities in that great mother-tongue, we are therefore to look for the source of the terms, more or less corrupted, that have been mentioned in the text. See Asiat. Res. Vol. IV. p. 223.
the tombs and manes of their deceased ancestors (nenek puyang). These they are attached to as strongly as to life itself, and to oblige them to remove from the neighbourhood of their krammat, is like tearing up a tree by the roots; these, the more genuine country people regard chiefly, when they take a solemn oath, and to these they apostrophize in instances of sudden calamity. Had they the art of making images, or other representations of them, they would be perfect lares, penates, or household gods. It has been asserted to me by the natives (conformably to what we are told by some of the early travellers) that in very ancient times, the Sumatrans made a practice of burning the bodies of their dead, but I could never find any traces of the custom, or any circumstances that corroborated it.

They have an imperfect notion of a metempsychosis, but not in any degree systematic, nor considered as an article of religious faith. Popular stories prevail amongst them, of such a particular man being changed into a tiger, or other beast. They seem to think, indeed, that tigers in general are actuated with the spirits of departed men, and no consideration will prevail on a countryman to catch or to wound one, but in self-defence, or immediately after the act of destroying a friend or relation. They speak of them with a degree of awe, and hesitate to call them by their common name (rimau or machang) terming them respectfully satwa (the wild animals), or even nenek (ancestors); as really believing them such, or by way of soothing and coaxing them; as our ignorant country folk call the fairies “the good people.” When an European procures traps to be set, by the means of persons less superstitious, the inhabitants of the neighbourhood have been known to go at night to the place, and practise some forms, in order to persuade the animal, when caught, or when he shall perceive the bait, that it was not laid by them, or with their consent. They talk of a place in the country where the tigers have a court, and maintain a regular form of government, in towns, the houses of which are thatched with women’s hair. It happened that in one month seven or eight people were killed by these prowling beasts in Manna district; upon which a report became current, that fifteen hundred of them were come down from Pas-summah; of which number, four were without understanding (gila), and
and having separated from the rest, ran about the country occasioning all the mischief that was felt. The alligators also are highly destructive, owing to the constant practice of bathing in the rivers, and are regarded with nearly the same degree of religious terour. Fear is the parent of superstition, by ignorance. Those two animals prove the Sumatran's greatest scourge. The mischief the former commit is incredible, whole villages being often depopulated by them, and the suffering people learn to reverence, as supernatural effects, the furious ravages of an enemy they have not resolution to oppose.

The Sumatrans are firmly persuaded that various particular persons are, what they term "betuah" (sacred, impassive, invulnerable, not liable to accident); and this quality they sometimes extend to things inanimate; as ships and boats. Such an opinion, which we should suppose every man might have an opportunity of bringing to the test of truth, affords a humiliating proof of the weakness and credulity of human nature, and the fallibility of testimony, when a film of prejudice obscures the light of the understanding. I have known two men, whose honesty, good faith, and reasonableness in the general concerns of life were well established, and whose assertions would have weight in transactions of consequence: these men I have heard maintain, with the most deliberate confidence, and an appearance of inward conviction of their own sincerity, that they had more than once, in the course of their wars, attempted to run their weapons into the naked body of their adversary, which they found impenetrable, their points being continually and miraculously turned, without any effort on the part of the orang betuah: and that hundreds of instances, of the like nature, where the invulnerable man did not possess the smallest natural means of opposition, had come within their observation. An English officer, with more courage and humour than discretion, exposed one imposture of this kind. A man having boasted in his presence, that he was endowed with this supernatural privilege, the officer took an opportunity of applying to his arm the point of a sword, and drew the blood; to the no little diversion of the spectators, and mortification of the pretender to superior gifts, who vowed revenge, and would have taken it, had not means been used to keep him at a distance. But a single detection of charlatanerie,
latanerie, is not effectual to destroy a prevalent superstition. These impostors are usually found among the Malays, and not the more simple country people.

No attempts, I have reason to think, have ever been made by missionaries, or others, to convert the inhabitants of the island to Christianity, and I have much doubt, whether the most zealous and able would meet with any permanent success in this pious work. Of the many thousands baptized in the eastern islands by the celebrated Francis Xavier, in the sixteenth century, not one of their descendants are now found to retain a ray of the light imparted to them; and probably, as it was novelty only, and not conviction, that induced the original converts to embrace a new faith, the impression lasted no longer than the sentiment which recommended it, and disappeared as rapidly as the itinerant apostle. Under the influence, however, of the Spanish government at Manilha, and of the Dutch at Batavia, there are many native Christians, educated as such from children. In the Malayan language Portuguese and Christians are confounded under the same general name; the former being called "orang Zerani," by corruption for "Nazerani." This neglect of missions to Sumatra is one cause that the interior of the country has been so little known to the civilized world.
HAVING thus far spoken of the manners and customs of the Rejangs more especially, and adverted, as occasion served, to those of the Passummah people, who nearly resemble them, I shall now present a cursory view of those circumstances in which their southern neighbours, the inhabitants of the Lampong country, differ from them, though this dissimilitude is not very considerable; and shall add such information as I have been enabled to obtain respecting the people of Korinchi, and other tribes dwelling beyond the ranges of hills which bound the pepper-districts.

By the Lampong country is understood, a portion of the southern extreme of the island, beginning, on the west coast, at the river of Padang-guchi, which divides it from Passummah, and extending across as far as Palembang, on the north-east side, at which last place the settlers are mostly Javans. On the south and east sides, it is washed by the sea, having several ports in the Straits of Sunda, particularly Keyser's and Lampong Bays; and the great river Tulang-bawang runs through the heart of it, rising from a considerable lake between the ranges of mountains. That division which is included by Padang-guchi, and a place called Nassal, is distinguished by the name of Briuran, and from thence southward to Flat-point, by that of Laut-Kawur; although Kawur, properly so called, lies in the northern division.

Upon the Tulang-bawang, at a place called Mangala, thirty-six leagues from its mouth, the Dutch have a fortified post. There also the representative of the king of Bantam, who claims the dominion of the whole country of Lampong, has his residence; the River Masusi, which runs into the former, being the boundary of his territories, and
those of the sultan of Palembang. In the neighbourhood of these rivers
the land is so low as to be overflowed in the rainy season, or months of
January and February, when the waters have been known to rise many
feet in the course of a few hours; the villages, situated on the higher
spots, appearing as islands. The houses of those immediately on the
banks are built on piles of iron-wood timber, and each has before it
a floating raft for the convenience of washing. In the western parts,
towards Samaūgka, on the contrary, the land is mountainous, and
Keyser’s Peak, as well as Pugong, are visible to a great distance at sea.

Inhabitants. The country is best inhabited in the central and mountainous parts,
where the people live independent, and in some measure secure from
the inroads of their eastern neighbours, the Javans, who, from about
Palembang and the Straits, frequently attempt to molest them. It is,
probably, within but a very few centuries, that the south-west coast of
this country has been the habitation of any considerable number of peo-
ple; and it has been still less visited by strangers, owing to the unshel-
tered nature of the sea therabouts, and want of soundings, in general,
which renders the navigation wild and dangerous for country vessels;
and to the rivers being small and rapid, with shallow bars and almost
ever a high surf. If you ask the people of these parts from whence they
originally came; they answer, from the hills, and point out an inland
place near the great lake, from whence, they say, their forefathers
emigrated: and further than this it is impossible to trace. They, of all
the Sumatrans, have the strongest resemblance to the Chinese, particu-
larly in the roundness of face, and constructure of the eyes. They are
also the fairest people of the island, and the women are the tallest, and
esteemed the most handsome.

Language. Their language differs considerably, though not essentially, from
that of the Rejangs, and the characters they use are peculiar to them-
selves; as may be observed in the specimens exhibited.

Government. The titles of government are paniGERAN (from the Javans), karijer, and
kiddimong or nebihi; the latter nearly answering to dupati among the
Rejangs. The district of KroI, near Mount Pugong, is governed by
five
five magistrates, called Paniggau-limo, and a sixth, superior, called by way of eminence, Paniggau; but their authority is said to be usurped, and is often disputed. The word, in common, signifies a gladiator or prize-fighter. The panigeran of Suko, in the hills, is computed to have four or five thousand dependants, and sometimes, on going a journey, he levies a tali, or eighth part of a dollar, on each family; which shews his authority to be more arbitrary, and probably more strictly feudal, than among the Rejangs, where the government is rather patriarchal. This difference has doubtless its source in the wars and invasions to which the former people are exposed.

The Javanese banditti, as has been observed, often advance into the country, and commit depredations on the inhabitants, who are not, in general, a match for them. They do not make use of fire-arms. Beside the common weapons of the island, they fight with aong lance, which is carried by three men; the foremost guiding the point, and covering himself and his companions with a large shield. A compact body, thus armed, would have been a counterpart of the Macedonian phalanx; but can prove, I should apprehend, of but little use among a people, with whom war is carried on in a desultory manner, and more in the way of ambuscade, than of general engagement, in which alone troops so armed could act with effect.

Inland of Samaṅka, in the Straits of Sunda, there is a district, say the Lampons, inhabited by a ferocious people, called orang Abung, who were a terror to the neighbouring country, until their villages were destroyed some years ago by an expedition from the former place. Their mode of atoning for offences against their own community, or, according to a Malayan narrative in my possession, of entitling themselves to wives, was, by bringing to their dusuns the heads of strangers. The account may be true, but, without further authentication, such stories are not to be too implicitly credited, on the faith of a people who are fond of the marvellous, and addicted to exaggeration. Thus they believed the inhabitants of the island Engano to be all females, who were impregnated by the wind; like the mares in Virgil's Georgics.
Manners.

The manners of the Lampons are more free, or rather licentious, than those of any other native Sumatrans. An extraordinary liberty of intercourse is allowed between the young people of different sexes, and the loss of female chastity is not a very uncommon consequence. The offence is there, however, thought more lightly of, and instead of punishing the parties, as in Passummah and elsewhere, they prudently endeavour to conclude a legal match between them. But if this is not effected, the lady still continues to wear the insignia of virginity, the fillet and arm-rings, and takes her place as such at festivals. It is not only on these public occasions, that the young men and women have opportunities of forming arrangements, as in most other parts of the island. They frequently associate together at other times; and the former are seen gallantly reclining in the maiden’s lap, whispering soft nonsense, whilst she adjusts and perfumes his hair, or does a friendly office of less delicacy to an European apprehension. At bimbangs, the women often put on their dancing dress in the public hall, letting that garment which they mean to lay aside, dexterously drop from under, as the other passes over the head; but sometimes, with an air of coquetry, displaying, as if by chance, enough to warm youthful imaginations. Both men and women anoint themselves before company, when they prepare to dance; the women, their necks and arms, and the men their breasts. They also paint each others faces; not, seemingly, with a view of heightening, or imitating the natural charms, but merely as matter of fashion; making fantastic spots with the finger on the forehead, temples, and cheeks, of white, red, yellow, and other hues. A brass salver (tallam) covered with little china cups, containing a variety of paints, is served up for this purpose.

Instances have happened here, though rarely, of very disagreeable conclusions to their feasts. A party of risaus among the young fellows, have been known suddenly to extinguish the lights, for the purpose of robbing the girls, not of their chastity, as might be apprehended, but of the gold and silver ornaments of their persons. An outrage of this nature I imagine could only happen in Lampong, where their vicinity to Java affords the culprits easier and surer means of escape, than in the central parts of the island; and here too their companies appear to be
be more mixed, collected from greater distances, and not composed, as with the Rejang people, of a neighbourly assemblage of the old men and women of a few contiguous villages, with their sons and daughters, for the sake of convivial mirth, of celebrating a particular domestic event, and promoting attachments and courtship amongst the young people.

In every dusun there is appointed a youth, well fitted by nature and education for the office, who acts as master of the ceremonies at their public meetings, arranges the young men and women in their proper places, makes choice of their partners, and regulates all other circumstances of the assembly, except the important economy of the festival part or cheer, which comes under the cognizance of one of the elders. Both parts of the entertainment are preceded by long, complimentary speeches, delivered by the respective stewards, who, in return, are answered and complimented on their skill, liberality, and other qualities, by some of the best bred amongst the guests. Though the manner of conducting, and the appendages of these feasts, are superior in style to the rustic hospitality of some of the northern countries, yet they are esteemed to be much behind those, in the goodness and mode of dressing their food. The Lampongs eat almost all kinds of flesh, indiscriminately, and their guleis (curries or made dishes) are said, by connoisseurs, to have no flavour. They serve up the rice, divided into portions for each person, contrary to the practice in the other countries; the tallam being covered with a handsome crimson napkin, manufactured for that use. They are wont to entertain strangers with much more profusion, than is met with in the rest of the island. If the guest is of any consequence, they do not hesitate to kill, beside goats and fowls, a buffalo, or several, according to the period of his stay, and the number of his attendants. One man has been known to entertain a person of rank and his suite for sixteen days, during which time there were not less than an hundred dishes of rice spread each day, containing, some one, some two bamboos. They have dishes here, of a species of china or earthen ware, called "batu benauang," brought from the eastward; remarkably heavy, and very dear; some of them being valued at 2 Q 2 forty
forty dollars a piece. The breaking one of them is a family loss of no small importance.

Reception of strangers.

Abundantly more ceremony is used among these people, at interviews with strangers, than takes place in the countries adjacent to them. Not only the chief person of a party travelling, but every one of his attendants, is obliged, upon arriving at a town, to give a formal account of their business, or occasion of coming that way. When the principal man of the dusun is acquainted by the stranger with the motives of his journey, he repeats his speech at full length, before he gives an answer; and if it is a person of great consequence, the words must pass through two or three mouths, before they are supposed to come with sufficient ceremony to his ears. This, in fact, has more the air of adding to his own importance and dignity, than to that of the guest; but it is not in Sumatra alone, that respect is manifested by this seeming contradiction.

Marriages.

The terms of the jujur, or equivalent for wives, is the same here, nearly, as with the Rejungs. The kris-head is not essential to the bargain, as among the people of Passummat. The father of the girl never admits of the putus tali kulo, or whole sum being paid, and thereby withholds from the husband, in any case, the right of selling his wife, who, in the event of a divorce, returns to her relations. Where the putus tali is allowed to take place, he has a property in her, little differing from that of a slave, as formerly observed. The particular sums which constitute the jujur are less complex here than at other places. The value of the maiden’s golden trinkets is nicely estimated, and her jujur regulated according to that, and the rank of her parents. The semando marriage scarcely ever takes place but among poor people, where there is no property on either side, or, in the case of a slip in the conduct of the female, when the friends are glad to make up a match in this way, instead of demanding a price for her. Instances have occurred, however, of countrymen of rank affecting a semando marriage, in order to imitate the Malayan manners; but it has been looked upon as improper; and liable to create confusion.

The
The fines and compensation for murder are in every respect the same, as in the countries already described.

The Mahometan religion has made considerable progress amongst the Lampong, and most of their villages have mosques in them; yet an attachment to the original superstitions of the country, induces them to regard with particular veneration the ancient burying-places of their fathers, which they piously adorn, and cover in from the weather.

In some parts, likewise, they superstitiously believe that certain trees, particularly those of a venerable appearance (as an old jawi-jawi or banyan tree) are the residence, or rather the material frame of spirits of the woods; an opinion which exactly answers to the idea entertained by the ancients, of the dryades and hama-dryades. At Benkunat, in the Lampong country, there is a long stone, standing on a flat one, supposed by the people to possess extraordinary power or virtue. It is reported to have been once thrown down into the water, and to have raised itself again to its original position; agitating the elements at the same time with a prodigious storm. To approach it without respect, they believe to be the source of misfortune to the offender.

The inland people of that country are said to pay a kind of adoration to the sea, and to make to it an offering of cakes and sweatmeats on their beholding it for the first time, deprecating its power of doing them mischief. This is by no means surprising, when we consider the natural proneness of unenlightened mankind, to regard with superstitious awe, whatever has the power of injuring them without control, and particularly when it is attended with any circumstances mysterious and inexplicable to their understandings. The sea possesses all these qualities. Its destructive and irresistible power is often felt, and especially on the coasts of India, where tremendous surfs are constantly breaking on the shore, rising often to their greatest degree of violence, without any apparent external cause. Add to this, the flux and reflux, and perpetual ordinary motion of that element; wonderful even to philosophers who are acquainted with the cause; unaccountable to ignorant men, though long accustomed to the effects; but to those who only once
once or twice in their lives have been eye witnesses to the phenomena, supernatural and divine. It must not, however, be understood, that any thing like a regular worship is paid to the sea by these people, any more than we should conclude, that people in England worship witches, when they nail a horse-shoe on the threshold, to prevent their approach, or break the bottoms of egg-shells, to hinder them from sailing in them. It is with the inhabitants of Lampong no more than a temporary sentiment of fear and respect, which a little familiarity soon effaces. Many of them, indeed, imagine it endowed with a principle of voluntary motion. They tell a story of an ignorant fellow, who observing with astonishment its continual agitation, carried a vessel of sea water with him, on his return to the country, and poured it into a lake, in full expectation of seeing it perform the same fanciful motions he had admired it for in its native bed.

The manners of the natives of the Philippine or Luzon Islands correspond in so many striking particulars with those of the inland Sumatrans, and especially where they differ most from the Malays, that I think no doubt can be entertained, if not of a sameness of origin, at least of an intercourse and connection in former times, which now no longer exists. The following instances are taken from an essay preserved by Thevenot, entitled Relation des Philippines par un religieux; traduite d’un manuscrit Espagnol du cabinet de Mons. Dom. Carlo del Pezzo (without date), and from a manuscript communicated to me by Alex. Dalrymple, Esq. “The chief Deity of the Tagalas is called Bathala mei Capal, and also Diwata; and their principal idolatry consists in adoring those of their ancestors, who signalized themselves for courage or abilities; calling them Humalagar, i.e. manes: They make slaves of the people who do not keep silence at the tombs of their ancestors. They have great veneration for the crocodile, which they call nono, signifying grandfather, and make offerings to it. Every old tree they look upon as a superior being, and think it a crime to cut it down. They worship also stones, rocks, and points of land, shooting arrows at these last as they pass them. They have priests, who, at their sacrifices, make many contortions and grimaces, as if possessed with a devil. The first man and woman, they say, were produced from a bamboo, which burst in the island of Sumatra; and they quarrelled about their marriage. The people mark their bodies in various figures, and render them of the colour of ashes: have large holes in their ears: blacken and file their teeth, and make an opening which they fill up with gold: they used to write from top to bottom, till the Spaniards taught them to write from left to right: bamboos and palm leaves serve them for paper. They cover their houses with straw, leaves of trees, or bamboo split in two, which serve for tiles. They hire people to sing and weep at their funerals; burn benzoin; bury their dead on the third day in strong coffins; and sometimes kill slaves to accompany their deceased masters.”
The latter account is more particular, and appears of modern date.

"They held the caiman, or alligator, in great reverence, and when they saw him they called him nono, or grandfather, praying with great tenderness that he would do them no harm, and to this end, offered him of whatever they had in their boats, throwing it into the water. There was not an old tree to which they did not offer divine worship, especially that called balete; and even at this time they have some respect for them. Beside these they had certain idols inherited from their ancestors, which the Tagalas called Anito, and the Bisayans, Divata. Some of these were for the mountains and plains, and they asked their leave when they would pass them: others for the corn fields, and to these they recommend them, that they might be fertile, placing meat and drink in the fields for the use of the Anitos. There was one, of the sea, who had care of their fishing and navigation; another of the house, whose favour they implored at the birth of a child, and under whose protection they placed it. They made Anitos also of their deceased ancestors, and to these were their first invocations in all difficulties and dangers. They reckoned amongst these beings, all those who were killed by lightning or alligators, or had any disastrous death, and believed that they were carried up to the happy state, by the rainbow, which they call Balan-gao. In general they endeavoured to attribute this kind of divinity to their fathers, when they died in years, and the old men, vain with this barbarous notion, affected in their sickness a gravity and composure of mind, as they conceived, more than human, because they thought themselves commencing Anitos. They were to be interred at places marked out by themselves, that they might be discovered at a distance and worshipped. The missionaries have had great trouble in demolishing their tombs and idols; but the Indians, inland, still continue the custom of pasing tabi sa nono, or asking permission of their dead ancestors, when they enter any wood, mountain, or corn field, for hunting or sowing; and if they omit this ceremony: imagine their nonos will punish them with bad fortune.

"Their notions of the creation of the world, and formation of mankind, had something ridiculously extravagant. They believed that the world at first consisted only of sky and water, and between these two, a glede; which, weary with flying about, and finding no place to rest, set the water at variance with the sky, which, in order to keep it in bounds, and that it should not get uppermost, loaded the water with a number of islands, in which the glede might settle and leave them at peace. Mankind, they said, sprang out of a large cane with two joints, that, floating about in the water, was at length thrown by the waves against the feet of the glede, as it stood on shore, which opened it with its bill, and the man came out of one joint, and the woman out of the other. These were soon after married by consent of their God, Bathala Meycopal, which caused the first trembling of the earth; and from thence are descended the different nations of the world."
Account of the inland Country of Korinchi—Expedition to the Serampei and Sungei-tenang Countries.

At the back of the range of high mountains by which the countries of Indrapura and Anak-sungei are bounded, lies the district or valley of Korinchi, which, from its secluded situation, has hitherto been little known to Europeans. In the year 1800, Mr. Charles Campbell, whose name I have had frequent occasion to mention, was led to visit this spot, in the laudable pursuit of objects for the improvement of natural history, and from his correspondence I shall extract such parts as I have reason to hope will be gratifying to the reader.

"The country of Korinchi," says this indefatigable traveller, "first occupied my attention. From the sea-coast, at Moco-moco, to the foot of the mountains, cost us three days' weary journey, and although our path was devious, I cannot estimate the distance at less than thirty miles, for it was late on the fourth day when we began to ascend. Your conjecture, that the ridge is broader betwixt the plains of Anak-sungei and valley of Korinchi, than that which we see from Bencoolen, is just. Our route in general lay north-east, until we attained the summit of the first high range; from which elevated situation, through an opening in the wood, the Pugi or Nassau Islands were clearly visible. During the next day our course along the ridge of hills was a little to the northward of north-west, and for the two following days almost due north, through as noble a forest as was ever penetrated by man. On the evening of the last, we descended by a steep and seemingly short path from the summit of the second range (for there are obviously two) into the Korinchi country. This descent did not occupy us more than twenty minutes, so that the valley must lie at a great height above the level of the sea; but it was yet a few days march to the inhabited and cultivated land on the border of the great lake, which I conjecture to be situated directly behind Indrapura,
Indrapura, or north-east from the mouth of that river. There are two lakes, but one of them is inconsiderable. I sailed for some time on the former, which may be nearly as broad as the strait between Bencoolen and Rat Island. My companions estimated it at seven miles; but the eye is liable to much deception, and having seen nothing for many days but rivulets, the grandeur of the sheet of water, when it first burst upon our sight, perhaps induced us to form too high a notion of its extent. Its banks were studded with villages; it abounds with fish, particularly the summah, a species of cyprinus; its waters are clear and beautiful, from the reflection of the black and shining sand which covers the bottom in many places to the depth of eight or ten inches.

"The inhabitants are below the common stature of the Malays, with harder visages and higher cheek-bones, well knit in their limbs, and active; not deficient in hospitality, but jealous of strangers. The women, excepting a few of the daughters of the chiefs, were in general ill-favoured, and even savage in their aspect. At the village of In-juan on the borders of the lake I saw some of them with rings of copper and shells among their hair; they wore destars round their heads like the men, and almost all of them had sixars or small daggers at their sides. They were not shut up or concealed from us, but mixed with our party, on the contrary, with much frankness. The people dwell in hordes, many families being crowded together in one long building. That in which I lived gave shelter to twenty-five families. The front was one long, undivided virandah, where the unmarried men slept; the back part was partitioned into small cabins, each of which had a round hole, with a door to fit it, and through this the female inmates crept backwards and forwards, in the most awkward manner and ridiculous posture. This house was in length two hundred and thirty feet, and elevated from the ground. Those belonging to the chiefs were smaller, well constructed of timber and plank, and covered with shingles or thin plates of board bound on with rattans, about the size, and having much the appearance, of our slates. The dresses of the young women of rank were pretty enough. A large blue turban, woven with silver chains, which, meeting behind and crossing, were fastened to the ear-rings in festoons, decorated their heads. In this was placed a large plume of cock's feathers,
Cookery.

Esculent vegetables.

Gold.

Gunpowder.

Lepers.

"In a small recess on the margin of the lake, overhung with very rugged cliffs, and accessible only by water, I saw one of those receptacles of
of misery to which the leprous, and others afflicted with diseases supposed to be contagious, are banished. I landed much against the remonstrances of my conductors, who would not quit the boat. There were in all seven of these unfortunate people basking on the beach, and warming the wretched remains of their bodies in the sun. They were fed at stated periods, by the joint contribution of the neighbouring villages, and I was given to understand, that any attempt to quit this horrid exile was punished with death.

"I had little time for botanizing; but I found there many plants unknown to the low lands. Among them were a species of prune, the water-hemlock, and the strawberry. This last was like that species which grows in our woods; but it was insipid. I brought the roots with me to Fort Marlborough, where it lingered a year or two after fruiting, and gradually died. I found there also a beautiful kind of the hedy-chium coronarium, now ranked among the kæmpferias. It was of a pale orange, and had a most grateful odour. The girls wear it in their hair, and its beautiful head of lily flowers is used in the silent language of love; to the practice of which, during your stay here, I suppose you were no stranger, and which indicates a delicacy of sentiment one would scarcely expect to find in the character of so rude a people.

"Although the chiefs received us with hospitality, yet the mass of people considered our intentions as hostile, and seemed jealous of our intrusion. Of their women, however, they were not at all jealous, and the familiarity of these was unrestrained. They entertained us with dances after their fashion, and made some rude attempts at performing a sort of pantomime. I may now close this detail with observing, that the natives of this mountainous region have stronger animal spirits than those of the plains, and pass their lives with more variety than the torpid inhabitants of the coast; that they breathe a spirit of independence, and being frequently engaged in warfare, village against village, they would be better prepared

* This plant has fruited also in England, but doubts are entertained of its being really a fragaria. By Dr. Smith it is termed a potentella.
prepared to resist any invasion of their liberties. They took great offence at a large package carried by six men, which contained our necessaries, insisting that within it we had concealed a priuk api, for so they call a mortar or howitzer, one of which had been used with success against a village on the borders of their country, during the rebellion of the son of the sultan of Moco-moco; and even when satisfied respecting this, they manifested so much suspicion, that we found it necessary to be constantly on our guard, and were once nearly provoked by their petulance and treachery to proceed to violence. When they found our determination, they seemed humble, but were not even then to be trusted; and when we were on our return, a friendly chief sent us intelligence that an ambuscade had been laid for us in one of the narrow passes of the mountains. We pursued our journey, however, without meeting any obstruction.” On the subject of gold I have only to add to Mr. Campbell’s information, that in the enumeration by the natives of places where there are gold-mines, Korinchi is always included.

Opportunities of visiting the interior parts of the island have so seldom occurred, or are likely to occur, that I do not hesitate to present to the reader an abstract of the Journal kept by Lieutenant Hastings Dare (now a captain on the Bengal establishment) whilst commanding an expedition to the countries of Ipu, Serampei, and Sungei-tenang, which border, to the south-east, on that of Korinchi above described; making at the same time my acknowledgments to that gentleman for his obliging communication of the original, and my apologies for the brevity to which my subject renders it necessary to confine the narrative.

“Sultan Asing, brother to the present sultan of Moco-moco, in conjunction with Pa Munchu and Sultan Sidi, two hill-chiefs his relations, residing at Pakalang-jambu and Jambi, raised a small force, with which, in the latter part of the year 1804, they made a descent on Ipu, one of the Company’s districts, burnt several villages, and carried off a number of the inhabitants. The guard of native Malay troops not being sufficiently strong to check these depredations, a party was ordered from Fort Marlborough, under the command of Lieut. Hastings Dare, consisting of eighty-three sepoy-officers and men, with five lascars, twenty-

two
two Bengal convicts, and eighteen of the Bugis-guard; in the whole one hundred and twenty-eight.

"Nov. 22, 1804. Marched from Fort Marlborough, and Dec. 3, arrived at Ipu. The roads extremely bad from the torrents of rain that fell. 4th. Mr. Hawthorne, the Resident, informed us that the enemy had fortified themselves at a place called Tabé-si-kuddi, but on hearing of the approach of the detachment, had gone off to the hills in the Suma
tenang country and fortified themselves at Koto Tuggoh, a village that had been a receptacle for all the vagabonds from the districts near the coast. 13th. Having procured coolies and provisions, for which we have been hitherto detained, quitted Ipu in an ENE. direction, and passed through several pepper and rice plantations. At dusun Baru one of our people caught a fine large fish, called ikan gadis. 14th. Marched in a SE. direction; crossed several rivulets, and reached again the banks of Ipu river, which we crossed. It was about four feet deep, and very rapid. Passed the night at dusun Arah. The country rather hilly; thermometer 88° at noon. 15th. Reached dusun Tanjong, the last place in the Ipu district where rice or any other provision is to be found, and these were sent on from Talang Puttei, this place being deserted by its inhabitants, several of whom the enemy had carried off with them as slaves. The country very hilly, and roads, in consequence of the heavy rains, bad and slippery. 16th. Marched in a N. and E. direction. After crossing the Ayer Ikan stream twice, we arrived at some hot springs, about three or four miles, in the winding course we were obliged to take, from dusun Tanjong, situated in a low, swampy spot, about sixty yards in circumference. This is very hot in every part of it, excepting (which is very extraordinary) one place on its eastern side, where, although a hot spring is bubbling up within one yard of it, the water running from it is as cold as common spring water. In consequence of the excessive heat of the place, and softness of the ground, none of us could get close to the springs; but uponputting the thermometer within three yards of them, it immediately rose to 120° of Fahrenheit. We could not bear our fingers any time in the water. It tasted copperish and bitter; there was a strong sulphureous smell at the place, and a green sediment at the bottom and sides of the spring, with a reddish or copper-coloured scum.
scum floating on the surface. After again crossing the Ikan stream we arrived at dusun Simpang. The enemy had been here, and had burned nearly half of the village, and carried off the inhabitants. The road from Tanjong to Simpang was entirely through a succession of pepper-gardens and rice plantations. We are now among the hills. Country in a higher state of cultivation than near the coast, but nearly deserted, and must soon become a waste. Could not get intelligence of the enemy. Built huts on Ayer Ikan, at Napah Kapah. 17th. Marched in a S. direction, and crossed Ayer Tubbu, passing a number of durian trees on its bank. Again crossed the stream several times. Arrived early at Tabé-si-kuddi, a small talang, where the enemy had built three batteries or entrenchments, and left behind them a quantity of grain, but vegetating and unfit for use. Previously to our reaching these entrenchments some of the detachment got wounded in the feet with ranjaus, set very thickly in the ground in every direction, and which obliged us to be very cautious in our steps, until we arrived at the banks of a small rivulet, called the Nibong, two or three miles beyond them. Ranjaus are slips of bamboo, sharpened at each end; the part that is stuck in the ground being thicker than the opposite end, which decreases to a fine, thin point, and is hardened by dipping it in oil and applying it to the smoke of a lamp near the flame. They are planted in the foot-paths, sometimes erect, sometimes sloping, in small holes, or in muddy and miry places, and when trodden upon (for they are so well concealed as not to be easily seen) they pierce through the foot and make a most disagreeable wound, the bamboo leaving in it a rough, hairy stuff it has on its outside, which irritates, inflames, and prevents it from healing. The whole of the road this day lay over a succession of steep hills, and in the latter part covered with deep forests. The whole of the detachment did not reach our huts on the bank of the Nibong stream till evening, much time being consumed in bringing on the mortar and magazine. Picked up pouches, musket stocks, &c. and saw new huts, near one of which was a quantity of clotted blood and a fresh grave. 18th. Proceeded ENE. and passed several rivulets. Regained the banks of the Ipu river, running NE. to SW. here tolerably broad and shallow, being a succession of rapids over a rough, stony bed. Encamped both this night and the last where the enemy had built huts. 19th. Marched in a N. direction.
More of the detachment wounded by ranjaus planted in the path-ways. Roads slippery and bad from rains, and the hills so steep, it is with difficulty we get the mortar and heavy baggage forward. Killed a green snake with black spots along its back; about four feet long, four to five inches in girt, and with a thick, stumpy tail. The natives say its bite is venomous. Our course to-day has been N. along the banks of the Ipu river; the noise of the rapids so great, that when near it we can with difficulty hear each other speak. 20th. Continued along the river, crossing it several times. Came to a hot spring, in the water of which the thermometer rose to 100°, at a considerable distance from its source. The road to-day tolerably level and good. We were much plagued by a small kind of leech, which dropped on us from the leaves of the trees, and got within side our clothes. We were, in consequence, on our halting every day, obliged to strip and bathe ourselves, in order to detach them from our bodies, filled with the blood they had sucked from us. They were not above an inch in length, and before they fixed themselves, as thin as a needle, so that they could penetrate our dress in any part. We encamped this evening at the conflux of the Simpang stream and Ipu river. Our huts were generally thatched with the puar or wild cardamum leaf, which grows in great abundance on the banks of the rivers in this part of the country. It bears a pleasant acid fruit, growing much in the same way as the maiz. In long journeys through the woods, when other provisions fail, the natives live principally on this. The leaf is something like that of the plantain, but not nearly so large. 21st. Arrived at a spot called Dingau-benar, from whence we were obliged to return on account of the coolies not being able to descend a hill which was at least an hundred and fifty yards high, and nearly perpendicular. In effecting it we were obliged to cling to the trees and roots, without which assistance it would have been impracticable. It was nearly evening before one half of the detachment had reached the bottom, and it rained so excessively hard, that we were obliged to remain divided for the night; the rear party on the top of the steep hill, and the advanced on the brow of another hill. One of the guides and a Malay cooley were drowned in attempting to find a ford across the Ipu river. I was a long time before we could get any fire, every thing being completely soaked through, and the greater part of the poor fellows had not time to build
build huts for themselves. Military disposition for guarding baggage, preventing surprise, &c. 22d. We had much difficulty in getting the mortar and its bed down, being obliged to make use of long, thick rattans, tied to them, and successively to several trees. It was reel admirably to observe the patience of the sepoys and Bengal convicts on this occasion. On mustering the coolies, found that nearly one half had run during the night, which obliged us to fling away twenty bags of rice, besides salt and other articles. Our course lay N. crossing the river several times. My poor faithful dog Gruff was carried away by the violence of the stream and lost. We were obliged to make bridges, by cutting down tall trees, laying them across the stream, and interlacing them with rattans.

"We were now between two ranges of very high hills; on our right hand Bukit Pandang, seen from a great distance at sea; the road shocking bad. Encamped on the western bank. 23d. Marched in a N. direction; the roads almost impassable. The river suddenly swelled so much, that the rear party could not join the advanced, which was so fortunate as to occupy huts built by the enemy. There were fires in two of them. We were informed, however, that the Serampei and Sungei-tenang people often come this distance to catch fish, which they dry and carry back to their country. At certain times of the year great quantities of the ringhis and ikan-gadis are taken, besides a kind of large conger-eel. We frequently had fish, when time would admit of the people catching them. It is impossible to describe the difficulties we had to encounter in consequence of the heavy rains, badness of the roads, and rapidity of the river. The sepoy officer and many men ill of fluxes and fevers, and lame with swelled and sore feet. 24th. Military precautions. Powder damaged. Thunder and lightning, with torrents of rain. Almost the whole of the rice rotten or sour. 25th. Continued to march up the banks of the river. No inhabitants in this part of the country. The compass for these several days has been very irregular. We have two with us, and they do not at all agree. The road less bad. At one place we saw bamboos of the thickness of a man’s thigh. There were myriads of very small flies this evening, which teasing us much. Occupied some huts we found on the eastern bank. This is Christmas evening;
ing; to us, God knows, a dull one. Our wines and liquors nearly expended, and we have but one miserable half-starved chicken left, although we have been on short allowance the whole way. 26th. Roads tolerable. Passed a spot called Kappah, and soon after a waterfall, named Ipu-machang, about sixty feet high. Picked up a sick man belonging to the enemy. He informed us that there were between two and three hundred men collected at Koto Tuggoh, under the command of Sutan Sidi, Sutan Asing, and Pa Muncha. These three chiefs made a festival, killing buffaloes, as is usual with the natives of Sumatra on such occasions, at this place, and received every assistance from the principal Dupati, who is also father-in-law to Pa Muncha. They possess sixty stand of muskets, beside blunderbusses and wall-pieces. They had quitted the Company’s districts about twenty-three days ago, and are gone, some to Koto Tuggoh, and others to Pakalang-fambu. 27th. Marched in a NNE. direction; passed over a steep hill which took us three hours hard walking. The river is now very narrow and rapid, not above twelve feet across; it is a succession of waterfalls every three or four yards. After this our road was intricate, winding, and bad. We had to ascend a high chasm formed in the rock, which was effected by ladders from one shelf to another. Arrived at the foot of Bukit Pandang, where we found huts, and occupied them for the night. We have been ascending the whole of this day. Very cold and rainy. At night we were glad to make large fires, and use our blankets and woollen clothes. Having now but little rice left, we were obliged to put ourselves to an allowance of one bamboo or gallon measure among ten men; and the greater part of that rotten. 28th. Ascended Bukit Pandang in an ENE. direction. Reached a small spring of water called Pondo Kubang, the only one to be met with till the hill is descended. About two miles from the top, and from thence all the way up, the trees and ground were covered very thick with moss; the trees much stunted, and altogether the appearance was barren and gloomy; to us particularly so, for we could find little or nothing wherewith to build our huts, nor procure a bit of dry wood to light a fire. In order to make one for dressing the victuals, Lieut. Dare was compelled to break up one of his boxes, otherwise he and Mr. Alexander, the surgeon, must have eaten them raw. It rained hard all night, and the coolies and most of the party were obliged to lie down.
Men die from severity of weather.

down on the wet ground in the midst of it. It was exceedingly cold to our feelings; in the evening the thermometer was down to 50°, and in the night to 45°. In consequence of the cold, inclemency, and fatigue, to which the coolies were exposed, seven of them died that night. The lieutenant and surgeon made themselves a kind of shelter with four tarpaulins that were fortunately provided to cover the medicine chest and surgical instruments, but the place was so small, that it scarcely held them both. In the evening when the former was sitting on his camp-stool, whilst the people were putting up the tarpaulins, a very small bird, perfectly black, came hopping about the stool, picking up the worms from the moss. It was so tame and fearless, that it frequently perched itself on his foot, and on different parts of the stool; which shews that these parts of the country must be very little frequented by human beings. 29th. Descended Bukit Pandang. Another cooley died this morning. We are obliged to fling away shells. After walking some time many of the people recovered, as it was principally from cold and damps they suffered. Crossed a stream called Inum, where we saw several huts. In half an hour more arrived at the banks of the greater Ayer Dikit river, which is here shallow, rapid, and about eighty yards broad. We marched westerly along its banks, and reached a hut opposite to a spot called Rantau Kramas, where we remained for the night, being prevented from crossing by a flood. 30th. Cut down a large tree and threw it across the river; it reached about half way over. With this, and the assistance of rattans tied to the opposite side, we effected our passage and arrived at Rantau Kramas. Sent off people to Ranna Alli, one of the Scrampei villages, about a day's march from hence, for provisions. Therm. 59°.

The greater Ayer Dikit river, on the N. side of which this place lies, runs nearly from E. to W. There are four or five bamboo huts at it, for the temporary habitation of travellers passing and repassing this way, being in the direction from the Scrampei to the Sungei-tenang country. These huts are covered with bamboos (in plenty here) split and placed like pantiles, transversely over each other, forming, when the bamboos are well-grown, a capital and lasting roof (see p. 58). 31st. A Malay man and woman taken by our people report, that the enemy, thirteen days
days ago, had proceeded two days march beyond Koto Tuggoh. Received some provisions from Ranna Alli. The enemy, we are informed, have dug holes, and put long stakes into them, set spring-spears, and planted the road very thickly with ranjaus, and were collecting their force at Koto Tuggoh (signifying the strong fortress) to receive us. 1805. Jan. 1st and 2d. Received some small supplies of provisions.

"On the 3d we were saluted by shouting and firing of the enemy from the heights around us. Parties were immediately sent off in different directions, as the nature of the ground allowed. The advanced party had only time to fire two rounds, when the enemy retired to a strong position on the top of a steep hill where they had thrown up a breastwork, which they disputed for a short time. On our getting possession of it, they divided into three parties and fled. We had one sepoy killed, and several of the detachment wounded by the ranjaus. Many of the enemy were killed and wounded, and the paths they had taken covered with blood; but it is impossible to tell their numbers, as they always carry them off the moment they drop, considering it a disgrace to leave them on the field of battle. If they get any of the bodies of their enemies, they immediately strike off the head, and fix it on a long pole, carrying it to their village as a trophy, and addressing to it every sort of abusive language. Those taken alive in battle are made slaves. After completely destroying every thing in the battery, we marched, and arrived at the top of a very high hill, where we built our huts for the evening. The road was thickly planted with ranjaus, which, with the heavy rains, impeded our progress, and prevented us from reaching a place called Danau-pau. Our course to-day has been NE. and easterly; the roads shockingly bad, and we were obliged to leave behind several coolies and two sepoys, who were unable to accompany us. 4th. Obliged to fling away the bullets of the cartridges, three-fourths of which were damaged, and other articles. Most of the detachment sick with fluxes and fevers, or wounded in the feet. Marched in an eastern direction. Reached a spot very difficult to pass, being knee-deep in mud for a considerable way, with ranjaus concealed in the mud, and spring-spears set in many places. We were obliged to creep through a thicket of canes and bamboos. About noon the advanced party arrived
at a lake, and discovered that the enemy were on the opposite side of a small stream that ran from the lake, where they had entrenched themselves behind four small batteries, in a most advantageous position, being on the top of a steep hill, of difficult access, with the stream on one side, the lake on the other, and the other parts surrounded by a swamp. We immediately commenced the attack, but were unable, from the number of ranjaus in the only accessible part, to make a push on to the enemy. However, about one o'clock, we effected our purpose, and completely got possession of the entrenchments, which, had they been properly defended, must have cost us more than the half of our detachment. We had four sepoys severely wounded, and almost the whole of our feet dreadfully cut. Numbers of the enemy were killed and wounded. They defended each of the batteries with some obstinacy against our fire, but when once we came near them, they could not stand our arms, and ran in every direction. At this place there are no houses nor inhabitants, but only temporary huts, built by the Sungei-tenang people, who come here occasionally to fish. The lake, which is named Danau-pau, has a most beautiful appearance, being like a great amphitheatre; surrounded by high and steep mountains covered with forests. It is about two miles in diameter. We occupied some huts built by the enemy. The place is thickly surrounded with bamboos.

"In consequence of the number of our sick and wounded, the small strength of coolies to carry their baggage, and the want of medicines and ammunition, as well as of provisions, we thought it advisable to return to Rantau Kramas; and to effect this, we were obliged to fling away the mortar-bed, shells, and a number of other things. We marched at noon, and arrived in the evening at the top of the hill where we had before encamped, and remained for the night. 6th. Reached Rantau Kramas. 7th. Marching in torrents of rain. People exceedingly harassed, reduced, and emaciated. Relieved by the arrival of Serampei people with some provisions from Ranna Alli. 8th. After a most fatiguing march, arrived at that place half-dead with damps and cold. The bearers of the litters for the sick were absolutely knocked up, and we were obliged to the sepoys for getting on as we did. Our route was NW. with little variation. 9th. Remained at Ranna Alli. This serampei village
village consists of about fifteen houses, and may contain an hundred and fifty or two hundred inhabitants. It is thickly planted all round with a tall hedge of live bamboos, on the outside of which ranjaus are planted to the distance of thirty or forty feet. Within side of the hedge there is a bamboo pagar or paling. It is situated on a steep hill surrounded by others, which in many places are cleared to their tops, where the inhabitants have their ladangs or rice plantations. They appeared to be a quiet, inoffensive set of people; their language different from the Malayan, which most of them spoke, but very imperfectly and hardly to be understood by us. On our approach, the women and children ran to their ladangs, being, as their husbands informed us, afraid of the sepoys. Of the women whom we saw, almost every one had the goitres or swellings under the throat; and it seemed to be more prevalent with these than with the men. One woman in particular had two protuberances dangling at her neck as big as quart bottles.

"There are three dupatis and four mantris to this village, to whom we made presents, and afterwards to the wives and families of the inhabitants. 10th and 11th. Preparing for our march to Moco-moco, where we can recruit our force, and procure supplies of stores and ammunition. 12th. Marched in a N. and NW. direction. Passed over a bridge of curious construction across the Ayer Abu river. It was formed of bamboos tied together with jiu ropes, and suspended to the trees, whose branches stretched nearly over the stream.

"The Serampei women are the worst favoured creatures we ever saw, and uncouth in their manners. Arrived at Tanjong Kasiri, another fortified village, more populous than Rama Alli. 13th. The sick and heavy baggage were ordered to Tanjong Agung, another Serampei village. 14th. Arrived at Ayer Grau or Abu, a small river, within a yard or two of which we saw columns of smoke issuing from the earth, where there were hot springs of water bubbling up in a number of places. The stream was quite warm for several yards, and the ground and stones were so hot, that there was no standing on them for any length of time. The large pieces of quartz, pumice, and other stones apparently burnt, induce us to suppose there must have formerly been a volcano at this spot,
spot, which is a deep vale, surrounded by high hills. Arrived much
fatigued at Tanjong Agung, where the head dupati received us in his
best style. He seemed to know more of European customs and manners
than those whom we have hitherto met with, and here, for the first time
since quitting the Ipu district, we got coconuts, which he presented to
us. We saw numbers of cassia-trees in our march to-day. The bark,
which the natives brought us in quantities, is sweet, but thick and
course, and much inferior to cinnamon. This is the last and best for-
tified village in the Serampei country, bordering on the forests between
that and Anak-Swai. They have a custom here of never allowing
any animal to be killed in any part of the village but the balei or town-
hall; unless the person wishing to do otherwise consents to pay a fine
of one fathom of cotton-cloth to the priest for his permission. The old
dupati told us there had been formerly a great deal of sickness and blood-
shed in the village, and it had been predicted, that unless this custom
were complied with, the like would happen again. We paid the fine,
had the prayers of the priest, and killed our goats where and as we
pleased. 16th. Marched in a south-westerly direction, and, after pass-
ing many steep hills, reached the lesser Ayer Dikit river, which we
crossed, and built our huts on its western bank. 17th. Marched in a
west, and afterwards a south, direction; the roads, in consequence of
the rain ceasing to-day, tolerably dry and good, but over high hills. Ar-
rived at Ayer Prikan, and encamped on its western bank; its course
N. and S. over a rough, stony bed; very rapid, and about thirty yards
across, at the foot of Bukit Lintang. Saw to-day abundance of cassia-
trees. 18th. Proceeded to ascend Bukit Lintang, which in the first part
was excessively steep and fatiguing; our route N. and NW. when de-
scending, SSW. Arrived at one of the sources of the Swai-ibu. De-
sceding still farther we reached a small spring, where we built our
huts. 19th. On our march this day we were gratified by the receipt of
letters from our friends at Bencoolen, by the way of Moco-moco, from
whence the Resident, Mr. Russell, sent us a supply of wine and other
refreshments, which we had not tasted for fourteen days. Our course
lay along the banks of the Swai-ibu, and we arrived at huts prepared
for us by Mr. Russell. 20th. At one time our guide lost the proper
path, by mistaking for it the track of a rhinoceros (which are in great
numbers
numbers in these parts), and we got into a place where we were teazed with myriads of leeches. Our road, excepting two or three small hills, was level and good. Reached the confluence of the Ipu and Si Luggan rivers, the latter of which rises in the Korinchi country. Passed Gunong Payong, the last hill, as we approached Moco-moco, near to which had been a village formerly burnt and the inhabitants made slaves by Pa Muncha and the then tuankumudo (son of the sultan). 21st. Arrived at talang Rantau Riang, the first Moco-moco or Anak-Sunigei village, where we found provisions dressed for us. At dusun Si Ballowe, to which our road lay south-easterly, through pepper and rice plantations, sampans were in readiness to convey us down the river. This place is remarkable for an arau tree (casuarina), the only one met with at such a distance from the sea. The country is here level in comparison with what we have passed through, and the soil rather sandy, with a mixture of red clay. 22d. The course of the river is SW. and W. with many windings. Arrived at Moco-moco.

Fort Ann lies on the southern and the settlement on the northern side of the Si Luggan river, which name belongs properly to the place also, and that of Moco-moco to a small village higher up. The bazar consists of about one hundred houses, all full of children. At the northern end is the sultan’s, which has nothing particular to distinguish it, but only its being larger than other Malay houses. Great quantities of fish are procured at this place, and sold cheap. The trade is principally with the hill-people, in salt, piece-goods, iron, steel, and opium; for which the returns are provisions, timber, and a little gold-dust. Formerly there was a trade carried on with the Padang and other até aṅgin people, but it is now dropped. The soil is sandy, low, and flat.

It being still necessary to make an example of the Sunigei-tenang people for assisting the three hostile chiefs in their depredations, in order thereby to deter others from doing the same in future; and the men being now recovered from their fatigue, and furnished with the requisite supplies, the detachment began to march, on the 9th of February, for Ayer Dikit. It now consists of Lieut. Dare, Mr. Alexander, surgeon, seventy sepoys, including officers, twenty-seven lascars and Bengal convicts.
victs, and eleven of the bugis-guard. Left the old mortar, and took with us one of smaller calibre. From the 10th to the 22d occupied in our march to the Srampe village of Ranna Alli. The people of this country acknowledge themselves the subjects of the sultan of Jambi, who sometimes, but rarely, exacts a tribute from them of a buffalo, a tail of gold, and an hundred bamboos of rice from each village. They are accustomed to carry burthens of from sixty to ninety pounds weight, on journeys that take them twenty or thirty days; and it astonishes a low-lander to see with what ease they walk over these hills, generally going a shuffling or ambling pace. Their loads are placed in a long, triangular basket, supported by a fillet across the forehead, resting upon the back and back part of the head, the broadest end of the triangle being uppermost, considerably above the head, and the small end coming down as low as the loins. The Srampe country, comprehending fifteen fortified and independent dusuns, beside talangs or small open villages, is bounded on the north and north-west by Korinchi, on the east, south-east, and south, by Pakalang-jambu and Sungei-tenang, and on the west and south-west by the greater Ayer Dikut river and chain of high mountains bordering on the Sungei-ipu country. 23d. Reached Rantau Kramas. Took possession of the batteries, which the enemy had considerably improved in our absence, collecting large quantities of stones; but they were not manned, probably from not expecting our return so soon. 24th. Arrived at those of Danau-pau, which had also been strengthened. The roads being dry and weather fine, we are enabled to make tolerably long marches. Our advanced party nearly caught one of the enemy planting ranjaus, and in retreating he wounded himself with them. 25th. Passed many small rivulets discharging themselves into the lake at this place. 26th. The officer commanding the advanced party sent word that the enemy were at a short distance a-head; that they had felled a number of trees to obstruct the road, and had thrown an entrenchment across it, extending from one swamp and precipice to another; where they waited to receive us. When the whole of the detachment had come up, we marched on to the attack, scrambled over the trees, and with great difficulty got the mortar over. The first onset was not attended with success, and our men were dropping fast, not being able to advance on account of the ranjaus, which almost
almost pinned their feet to the ground. Seeing that the entrenchments were not to be carried in front, a subedar, with thirty sepoys, and the bugis-guard, were ordered to endeavour to pass the swamp on the right, find out a path-way, and attack the enemy on the flank and rear, while the remainder should, on a preconcerted signal, make an attack on the front at the same time. To prevent the enemy from discovering our intentions, the drums were kept beating, and a few random shots fired. Upon the signal being given, a general attack commenced, and our success was complete. The enemy, of whom there were, as we reckon, three or four hundred within the entrenchments, were soon put to the rout, and, after losing great numbers, among whom was the head dupati, a principal instigator of the disturbances, fled in all directions. We lost two sepoys killed and seven wounded, beside several much hurt by the ranjaus. The mortar played during the time, but is not supposed to have done much execution, on account of the surrounding trees. The entrenchments were constructed of large trees laid horizontally between stakes driven into the ground, about seven feet high, with loop-holes for firing. Being laid about six feet thick, a cannon-ball could not have penetrated. They extended eighty or ninety yards. The head-man's quarters were a large tree hollowed at the root.

"As soon as litters could be made for the wounded, and the killed were buried, we continued our march in an eastern direction, and in about an hour arrived at another battery, which, however, was not defended. In front of this the enemy had tied a number of long, sharp stakes to a stone, which was suspended to the bough of a tree, and by swinging it, their plan was to wound us. Crossed the Tambesi rivulet, flowing from south to north, and one of the contributary streams to the Jambi river, which discharges itself into the sea on the eastern side of the island. Built our huts near a field of maiz and padi. 27th. Marched to Koto Tuggoh, from whence the inhabitants fled on our throwing one shell and firing a few muskets, and we took possession of the place. It is situated on a high hill, nearly perpendicular on three sides, the easiest entrance being on the west, but it is there defended by a ditch seven fathoms deep and five wide. The place contains the ballei and about twenty houses, built in general of plank very neatly put together, and carved;
and some of them were also roofed with planks or shingles, about two feet long and one broad. The others, with the leaves of the puar or cardamum, which are again very thinly covered with iju. This is said to last long, but harbours vermin, as we experienced. When we entered the village we met with only one person, who was deformed, dumb, and had more the appearance of a monkey than a human creature. March 1st. After completely destroying Koto Tuggoh, we marched in a N. and afterwards an E. direction, and arrived at Koto Bharu. The head dupati requesting a parley, it was granted, and, on our promising not to injure his village, he allowed us to take possession of it. We found in the place a number of Batang Asei and other people, armed with muskets, blunderbusses, and spears. At our desire, he sent off people to the other Sungei-tenang villages, to summon their chiefs to meet us, if they chose to shew themselves friends, or otherwise we should proceed against them as we had done against Koto Tuggoh. This dupati was a respectable looking old man, and tears trickled down his cheeks when matters were amicably settled between us: indeed, for some time, he could hardly be convinced of it, and repeatedly asked, "Are we friends?" 2d. The chiefs met as desired, and after a short conversation agreed to all that we proposed. Papers were thereupon drawn up, and signed and sworn to under the British colours. After this, a shell was thrown into the air, at the request of the chiefs, who were desirous of witnessing the sight.

"Their method of swearing was as follows: The young shoots of the anau-tree were made into a kind of rope, with the leaves hanging, and this was attached to four stakes stuck in the ground, forming an area of five or six feet square, within which a mat was spread, where those about to take the oath seated themselves. A small branch of the prickly bamboo was planted in the area also, and benzoin was kept burning during the ceremony. The chiefs then laid their hands on the korān, held to them by a priest, and one of them repeated to the rest the substance of the oath, who, at the pauses he made, gave a nod of assent; after which they severally said, "may the earth become barren, the air and water poisonous, and may dreadful calamities fall on us and our posterity, if we do not fulfil what we now agree to and promise."

"We
We met here with little or no fruit, excepting plantains and pineapples, and these of an indifferent sort. The general produce of the country was maiz, padi, potatoes, sweet potatoes, tobacco, and sugar-canes. The principal part of their clothing was procured from the eastern side of the island. They appear to have no regular season for sowing the grain, and we saw plantations where in one part they had taken in the crop, in another part it was nearly ripe, in a third not above five inches high, and in a fourth they had but just prepared the ground for sowing. Upon the whole, there appeared more cultivation than near the coast. It is a practice with many individuals among these people (as with mountaineers in some parts of Europe) to leave their country in order to seek employment where they can find it, and at the end of three or four years revisit their native soil, bringing with them the produce of their labours. If they happen to be successful, they become itinerant merchants, and travel to almost all parts of the island, particularly where fairs are held, or else purchase a match-lock-gun, and become soldiers of fortune, hiring themselves to whoever will pay them, but always ready to come forward in defence of their country and families. They are a thick, stout, dark race of people, something resembling the Achinese; and in general they are addicted to smoking opium. We had no opportunity of seeing the Sungei-tenang women. The men are very fantastical in their dress. Their bajus have the sleeves blue, perhaps, whilst the body is white, with stripes of red or any other colour over the shoulders, and their short breeches are generally one half blue and the other white, just as fancy leads them. Others again are dressed entirely in blue cotton cloth, the same as the inhabitants of the west coast. The bag containing their sirih or betel hangs over the shoulder by a string, if it may be so termed, of brass-wire. Many of them have also twisted brass-wire round the waist, in which they stick their krises. They commonly carry charms about their persons to preserve them from accidents; one of which was shewn to us, printed (at Batavia or Samarang in Java) in Dutch, Portuguese, and French. It purported that the writer was acquainted with the occult sciences, and that whoever possessed one of the papers impressed with his mark (which was the figure of a hand with the thumb and fingers extended) was invulnerable and free from all kinds of harm. It desired the people to be very cautious of taking any such, printed
in London (where, certainly, none were ever printed), as the English would endeavour to counterfeit them and to impose on the purchasers, being all cheats. (Whether we consider this as a political or a mercantile speculation, it is not a little extraordinary and ridiculous). The houses here, as well as in the Serampei country, are all built on posts of what they call paku gajah (elephant-fern, chamaerops palma, Lour). a tree something resembling a fern, and when full-grown, a palm-tree. It is of a fibrous nature, black, and lasts for a great length of time. Every dusun has a ballei or town-hall, about an hundred and twenty feet long and proportionably broad, the wood-work of which is neatly carved. The dwelling-houses contain five, six, or seven families each, and the country is populous. The inhabitants both of Sungei-tenang and Serampei are Mahometans, and acknowledge themselves subjects of Jambi. The former country, so well as we were able to ascertain, is bounded on the N. and NW. by Korinchi and Serampei, on the W. and SW. by the Anak-sungei or Moco-moco and Ipu districts, on the S. by Labun, and on the E. by Batang Asei and Pakalang-jambu. 3d. Marched on our return to the coast, many of the principal people attending us as far as the last of their plantations. It rained hard almost the whole of this day. On the 14th arrived at Moco-moco; on the 22d proceeded for Bencoolen, and arrived there on the 30th March, 1805, after one of the most fatiguing and harassing expeditions any detachment of troops ever served upon; attended with the sickness of the whole of the party, and the death of many, particularly of Mr. Alexander, the surgeon.” It is almost unnecessary to observe, that these were the consequences of the extreme impolicy of sending an expedition up the country in the heart of the rainy season. The public orders issued on the occasion were highly creditable to Lieutenant Dare.

I SHALL now take a more particular view of the Malayan states, as distinguished from those of the people termed orang ulu or countrymen, and orang dusun or villagers, who, not being generally converted to the Mahometan religion, have thereby preserved a more original character.

The principal government, and whose jurisdiction in ancient times is understood to have comprehended the whole of Sumatra, is *Menangkabau,* situated under the equinoctial line, beyond the western range of high mountains, and nearly in the centre of the island; in which respect it differs from Malayan establishments in other parts, which are almost universally near the mouths of large rivers. The appellations, however, of orang *menangkabau* and orang *malayo* are so much identified, that previously to entering upon an account of the former, it will be useful to throw as much light as possible upon the latter, and to ascertain to what description of people the name of Malays, bestowed by Europeans upon all who resemble them in features and complexion, properly belongs.

It has hitherto been considered as an obvious truth, and admitted without

---

* The name is said to be derived from the words *menang,* signifying "to win," and *karbau,* a buffalo; from a story, carrying a very fabulous air, of a famous engagement on that spot between the buffaloes and tigers, in which the former are stated to have acquired a complete victory. Such is the account the natives give; but they are fond of dealing in fiction, and the etymology has probably no better foundation than a fanciful resemblance of sound.
without examination, that wherever they are found upon the numerous islands forming this archipelago, they, or their ancestors, must have migrated from the country named by Europeans (and by them alone) the Malayan peninsula or peninsula of Malacca, of which the indigenous and proper inhabitants were understood to be Malays; and accordingly in the former editions of this work I spoke of the natives of Menanigkabau as having acquired their religion, language, manners, and other national characteristics, from the settling among them of genuine Malays from the neighbouring continent. It will, however, appear from the authorities I shall produce, amounting as nearly to positive evidence as the nature of the subject will admit, that the present possessors of the coasts of the peninsula were, on the contrary, in the first instance adventurers from Sumatra, who, in the twelfth century, formed an establishment there, and that the indigenous inhabitants, gradually driven by them to the woods and mountains, so far from being the stock from whence the Malays were propagated, are an entirely different race of men, nearly approaching in their physical character to the negroes of Africa.

The evidences of this migration from Sumatra are chiefly found in two Malayan books well known, by character at least, to those who are conversant with the written language, the one named Taju assalatin or Makuta segala raja-raja, The Crown of all Kings, and the other, more immediately to the purpose, Sulalat assalatin or Penurun-an segala raja-raja, The Descent of all (Malayan) Kings. Of these it has not been my good fortune to obtain copies, but the contents, so far as they apply to the present subject, have been fully detailed by two eminent Dutch writers, to whom the literature of this part of the East was familiar. Petrus van der Worm first communicated the knowledge of these historical treatises in his learned Introduction to the Malayan Vocabulary of Gueynier, printed at Batavia in the year 1677; and extracts to the same effect were afterwards given by Valentyn in Vol. V. p. 316-20 of his elaborate work, published at Amsterdam in 1726. The books are likewise mentioned in a list of Malayan Authors, by G. H. Werndly, at the end of his Maleische Spraak-kunst, and by the ingenious Dr. Leyden in his Paper on the Languages and Literature of the Indo-Chinese Nations, recently published in Vol. X. of the Asiatic Researches. The substance
substance of the information conveyed by them is as follows; and I trust it will not be thought that the mixture of a portion of mythological fable in accounts of this nature, invalidates what might otherwise have credit as historical fact. The utmost, indeed, we can pretend to ascertain is, what the natives themselves believe to have been their ancient history; and it is proper to remark, that in the present question there can be no suspicion of bias from national vanity, as we have reason to presume that the authors of these books were not Sumatrans.

The original country inhabited by the Malayan race (according to these authorities) was the kingdom of Palembang in the island of Indalus, now Sumatra, on the river Malaya, which flows by the mountain named Maha-meru, and discharges itself into the river Tatang (on which Palembang stands) before it joins the sea. Having chosen for their king or leader a prince named Sri Turi Buwana, who boasted his descent from Iskander the Great, and to whom, on that account, their natural chief Demang Lebar Daun submitted his authority, they emigrated, under his command, (about the year 1160) to the south-eastern extremity of the opposite peninsula, named Ujong Tanah, where they were at first distinguished by the appellation of orang de-bawah aṅgin or the Leeward people, but in time the coast became generally known by that of Tanah malayo or the Malayan land.

In this situation they built their first city, which they called Siṅga-pura (vulgarily Sincapore), and their rising consequence excited the jealousy of the kings of Maja-pahit, a powerful state in the island of Java. To Sri Turi Buwana, who died in 1208, succeeded Paduka Pikaram Wira, who reigned fifteen years; to him Sri Rama Vikaram, who reigned thirteen, and to him Sri Maharaja, who reigned twelve. His successor, Sri Iskander Shah, was the last king of Siṅga-pura. During three years he withstood the forces of the king of Maja-pahit, but in 1252, being hard pressed, he retired first to the northward, and afterwards to the western, coast of the peninsula, where, in the following year, he founded a new city, which under his wise government became of considerable importance. To this he gave the name of Malaka, from a fruit-bearing tree so called (myrabolanum) found in abundance on the hill
hill which gives natural strength to the situation. Having reigned here twenty-two years, beloved by his subjects and feared by his neighbours, Iskander Shah died in 1274, and was succeeded by Sultan Magat, who reigned only two years. Up to this period the Malayan princes were pagans. Sultan Muhammed Shah, who ascended the throne in 1276, was the first Mahometan prince, and by the propagation of this faith acquired great celebrity during a long reign of fifty-seven years. His influence appears to have extended over the neighbouring islands of Lingga and Bintan, together with Johor, Patani, Kedah, and Perak, on the coasts of the peninsula, and Campar and Aru in Sumatra; all of which acquired the appellative of Malayo, although it was now more especially

* The account given by John de Barros of the abandonment of the Malayan city of Singa-pura and foundation of Malacca, differs materially from the above; and although the authority of a writer, who collected his materials in Lisbon, cannot be put in competition with that of Valentyn, who passed a long and laborious life amongst the people, and quotes the native historians, I shall give an abstract of his relation, from the sixth book of the second Decade. "At the period when Cingapura flourished, its king was named Sangesinga; and in the neighbouring island of Java reigned Paráriso, upon whose death the latter country became subject to the tyranny of his brother, who put one of his nephews to death, and forced many of the nobles, who took part against him, to seek refuge abroad. Among these was one named Paramisora, whom Sangesinga received with hospitality that was badly requited, for the stranger soon found means to put him to death, and by the assistance of the Javans who accompanied him in his flight, to take possession of the city. The king of Siam, whose son-in-law and vassal the deceased was, assembled a large force by sea and land, and compelled the usurper to evacuate Cingapura with two thousand followers, a part of whom were Cellates (orang sellat men of the Straits) accustomed to live by fishing and piracy, who had assisted him in seizing and keeping the throne during five years. They disembarked at a place called Muar, an hundred and fifty leagues from thence, where Paramisora and his own people fortified themselves. The Cellates, whom he did not chuse to trust, proceeded five leagues farther, and occupied a bank of the river where the fortress of Malacca now stands. Here they united with the half-savage natives, who, like themselves, spoke the Malayan language, and the spot they had chosen becoming too confined for their increasing numbers, they moved a league higher up, to one more convenient, and were at length joined by their former chief and his companions. During the government of his son, named Xaqien Darza (a strange Portuguese corruption of Iskander or Sekander Shah) they again descended the river, in order to enjoy the advantages of a sea-port, and built a town, which, from the fortunes of his father, was named Malacca, signifying an exile." Every person conversant with the language must know that the word does not bear that nor any similar meaning, and an error so palpable throws discredit on the whole narrative.
SUMATRA.

especially applied to the people of Malaka, or, as it is commonly written, Malacca. He left the peaceful possession of his dominions to his son Sultan Abu Shahid, who had reigned only one year and five months, when he was murdered in 1334 by the king of Arrakan, with whose family his father had contracted a marriage. His successor was Sultan Modafar or Mizafar Shah, who was distinguished for the wisdom of his government, of which he left a memorial in a Book of Institutes or Laws of Malaka, held to this day in high estimation. This city was now regarded as the third in rank (after Maja-pahit on Java, and Pasé on Sumatra) in that part of the East.

About the year 1340 the king of Siam being jealous of the growing power of Malaka, invaded the country, and in a second expedition laid siege to the capital; but his armies were defeated by the general of Modafar, named Sri Nara Dirija. After these events Modafar reigned some years with much reputation, and died in 1374. His son, originally named Sultan Abdul, took the title of Sultan Mansur Shah upon his accession. At the time that the king of Maja-pahit drove the Malays from Singa-pura, as above related, he likewise subdued the country of Indragiri in Sumatra; but upon the occasion of Mansur Shah's marriage (about the year 1380) with the daughter of the then reigning king, a princess of great celebrity, named Radin Gala Chendra Kiran, it was assigned to him as her portion, and has since continued (according to Valentyn) under the dominion of the princes of Malaka. Mansur appears to have been engaged in continual wars, and to have obtained successes against Pahang, Pasé, and Makasar. His reign extended to the almost incredible period of seventy-three years, being succeeded in 1447 by his son Sultan Ala-wa-eddín. During his reign of thirty years nothing particular is recorded; but there is reason to believe that his country during some part of that time was under the power of the Siamese. Sultan Mahmud Shah, who succeeded him, was the twelfth Malayan king, and the seventh and last king of Malaka. In 1509 he repelled the aggression of the king of Siam; but in 1511 was conquered by the Portuguese under Alfonso d'Albuquerque, and forced, with the principal inhabitants, to fly to the neighbourhood of the first Malayan establishment at the extremity of the peninsula, where he founded the city of Johor, which still
still subsists, but has never attained to any considerable importance, owing, as it may be presumed, to the European influence that has ever since, under the Portuguese, Hollanders, and English, predominated in that quarter.

With respect to the religion professed by the Malayan princes at the time of their migration from Sumatra, and for about 116 years after, little can be known, because the writers, whose works have reached us, lived since the period of conversion, and as good Mahometans would have thought it profane to enter into the detail of superstitions, which they regard with abhorrence; but, from the internal evidence we can entertain little doubt of its having been the religion of Brahna, much corrupted, however, and blended with the antecedent rude idolatry of the country, such as we now find it amongst the Battas. Their proper names or titles are obviously Hindu, with occasional mixture of Persian, and their mountain of Maha-meru, elsewhere so well known as the seat of Indra and the dewas, sufficiently points out the mythology adopted in the country. I am not aware that at the present day there is any mountain in Sumatra called by that name; but it is reasonable to presume that appellations decidedly connected with Paganism may have been changed by the zealous propagators of the new faith, and I am much inclined to believe, that by the Maha-meru of the Malays is to be understood the mountain of Sungei-pagu in the Menangkabau country, from whence issue rivers that flow to both sides of the island. In the neighbourhood of this reside the chiefs of the four great tribes, called ampat suku or four quarters,

* It was subdued by the Portuguese in 1608. In 1641 Malacca was taken from them by the Hollanders, who held it till the present war, which has thrown it into the possession of the English. The interior boundaries of its territory, according to the Transactions of the Batavian Society, are the mountains of Rombou, inhabited by a Malayan people named Maning Cabou, and Mount Ophir, called by the natives Gunong-Ledang. These limits, say they, is impracticable for an European to pass, the whole coast, for some leagues from the sea, being either a morass or impenetrable forest; and these natural difficulties are aggravated by the treacherous and blood-thirsty character of the natives. The description, which will be found in Vol. IV. p. 333-4, is evidently overcharged. In speaking of Johor, the original emigration of a Malayan colony from Sumatra to the mouth of that river, which gave its name to the whole coast, is briefly mentioned.
quarters, one of which is named Malayo, (the others, Kampi, Pani, and Tiga-lara); and it is probable, that to it belonged the adventurers who undertook the expedition to Ujong Tanah, and perpetuated the name of their particular race in the rising fortunes of the new colony. From what circumstances they were led to collect their vessels for embarkation at Palembang rather than at Indra-giri or Siak, so much more convenient in point of local position, cannot now be ascertained.

Having proposed some queries upon this subject to the late Mr. Francis Light, who first settled the island of Pinang or Prince of Wales island, in the Straits of Malacca, granted to him by the king of Kedah as the marriage portion of his daughter, he furnished me, in answer, with the following notices. "The origin of the Malays, like that of other people, is involved in fable; every raja is descended from some demigod, and the people sprung from the ocean. According to their traditions, however, their first city of Singa-pura, near the present Johor, was peopled from Palembang, from whence they proceeded to settle at Malacca (naming their city from the fruit so called), and spread along the coast. The peninsula is at present inhabited by distinct races of people. The Siamese possess the northern part to latitude 7°, extending from the east to the west side. The Malays possess the whole of the sea-coast on both sides, from that latitude to Point Romania; being mixed in some places with the Bugis from Celebes, who have still a small settlement at Salanâgor. The inland parts to the northward are inhabited by the Patâni people, who appear to be a mixture of Siamese and Malays, and occupy independent dusuns or villages. Among the forests and in the mountains are a race of Caffres, in every respect resembling those of Africa, excepting in stature, which does not exceed four feet eight inches. The Menaâgkabau people of the peninsula are so named from an inland country in Pulo Percha (Sumatra). A distinction is made between them and the Malays of Johor, but none is perceptible."

To these authorities I shall add that of Mr. Thomas Raffles, at this time Secretary to the government of Pulo Pinang, a gentleman whose intelligence, and zeal in the pursuit of knowledge, give the strongest hope of his becoming an ornament to oriental literature. To his corres-
pondence I am indebted for much useful information in the line of my researches, and the following passages corroborate the opinions I had formed. "With respect to the Menangkabaus, after a good deal of inquiry, I have not yet been able decidedly to ascertain the relation between those of that name in the peninsula, and the Menangkabaus of Pulo Percha. The Malays affirm without hesitation, that they all came originally from the latter island." In a recent communication he adds, "I am more confident than ever that the Menangkabaus of the peninsula derive their origin from the country of that name in Sumatra. Inland of Malacca about sixty miles is situated the Malay kingdom of Rumbo, whose sultan and all the principal officers of state hold their authority immediately from Menangkabau, and have written commissions for their respective offices. This shews the extent of that ancient power even now, reduced as it must be, in common with that of the Malay people in general. I had many opportunities of communicating with the natives of Rumbo, and they have clearly a peculiar dialect, resembling exactly what you mention of substituting the final o for a, as in the word ambo for amba. In fact, the dialect is called by the Malacca people the language of Menangkabau."

Returning from this discussion, I shall resume the consideration of what is termed the Sumatran empire of Menangkabau, believed by the natives of all descriptions to have subsisted from the remotest times. With its annals, either ancient or modern, we are little acquainted, and the existence of any historical records in the country has generally been doubted; yet, as those of Malacca and of Achin have been preserved, it is not hastily to be concluded, that these people, who are the equals of the former, and much superior to the latter, in point of literature, are destitute of theirs, although they have not reached our hands. It is known, that they deduce their origin from two brothers, named Perapatitsi-batang and Kei Tamaṅgguṅgan, who are described as being among the forty companions of Noah in the ark, and whose landing at Palembang, or at a small island near it, named Laṅgka-pura, is attended with the circumstance of the dry land being first discovered by the resting upon it of a bird that flew from the vessel. From thence they proceeded to the mountain named Siguntang-guntang, and afterwards to Prijango.

History of Menangkabau imperfectly known.
in the neighbourhood of the great volcano, which at this day is spoken of as the ancient capital of Menāṅgkaban. Unfortunately, I possess only an imperfect abstract of this narrative, obviously intended for an introduction to the genealogy of its kings, but, even as a fable, extremely confused and unsatisfactory; and when the writer brings it down to what may be considered as the historical period, he abruptly leaves off, with a declaration, that the offer of a sum of money (which was unquestionably his object) should not tempt him to proceed.

At a period not very remote its limits were included between the river Limits. of Palembang and that of Siak, on the eastern side of the island, and on the western side between those of Manjuta (near Indra-pura) and Siṅgel, where (as well as at Siak) it borders on the independent country of the Battas. The present seat, or more properly seats of the divided government, lie at the back of a mountainous district named the Tiga-blas koto (signifying the thirteen fortified and confederated towns) inland of the settlement of Padang. The country is described as a large plain surrounded by hills producing much gold, clear of woods, and comparatively well cultivated. Although nearer to the western coast, its communications with the eastern side are much facilitated by water-carriage. Advantage is taken in the first place of a large lake, called Laut-danau, Lake. situated at the foot of the range of high mountains named gunong Besi, inland of the country of Priaman, the length of which is described by some as being equal to a day’s sailing, and by others as no more than twenty-five or thirty miles, abounding with fish (especially of two species, known by the names of sasau and bili), and free from alligators. From this, according to the authority of a map drawn by a native, issues a river called Ayer Ambelan, which afterwards takes the name of Indragiri, along which, as well as the two other great rivers of Siak to the northward, and Jambi to the southward, the navigation is frequent, the banks of all of them being peopled with Malayan colonies. Between Menāṅgkaban and Palembang the intercourse must, on account of the distance, be very rare, and the assertion, that in the intermediate country there exists another great lake, which sends its streams to both sides of the island, appears not only to be without foundation in fact, but also at variance with the usual operations of nature; as I believe it may
may be safely maintained, that however numerous the streams which furnish the water of a lake, it can have only one outlet; excepting, perhaps, in flat countries, where the course of the waters has scarcely any determination, or under such a nice balance of physical circumstances as is not likely to occur.

When the island was first visited by European navigators, this state must have been in its decline, as appears from the political importance, at that period, of the kings of Achin, Pedir, and Pasé, who, whilst they acknowledged their authority to be derived from him as their lord paramount, and some of them paid him a trifling complimentary tribute, acted as independent sovereigns. Subsequently to this an Achinese monarch, under the sanction of a real or pretended grant, obtained from one of the sultans, who, having married his daughter, treated her with nuptial slight, and occasioned her to implore her father’s interference, extended his dominion along the western coast, and established his panglimas or governors in many places within the territory of Menang-kabau, particularly at Priaman, near the great volcano-mountain. This grant is said to have been extorted, not by the force of arms, but by an appeal to the decision of some high court of justice, similar to that of the imperial chamber in Germany, and to have included all the low or strand-countries (pasisir barat) as far southward as Bengkulu or Silebar. About the year 1613, however, he claimed no farther than Padang, and his actual possessions reached only to Barus.

* The following instances occur of mention made by writers, at different periods, of the kingdom of Menang’kabau. **Odardus Barrosa,** 1519. “Sumatra, a most large and beautiful island; Pedir, the principal city on the northern side, where are also Pacem and Achem. Campar is opposite to Malacca. **Monancabo,** to the southward, is the principal source of gold, as well from mines as collected in the banks of the rivers.” De Barros, 1553. “Malacca had the epithet of aurea given to it on account of the abundance of gold brought from **Monancabo** and Barros, countries in the island of Caramata, where it is procured.” **Diogo de Couto,** 1600. “He gives an account of a Portuguese ship wrecked on the coast of Sumatra, near to the country of Monancabo, in 1560. Six hundred persons got on shore, among whom were some women, one of them, **Dona Francisca Sardinha,** was of such remarkable beauty, that the people of the country resolved to carry her off for their king; and they effected it, after
In consequence of disturbances that ensued upon the death of a sultan Alif in the year 1680, without direct heirs, the government became divided amongst three chiefs, presumed to have been of the royal family and at the same time great officers of state, who resided at places named Suruwasa, Pagar-ruyong, and Sung'e-trap; and in that state it continues to the present time. Upon the capture of Padang by the English in 1781, deputations arrived from two of these chiefs with congratulations upon the success of our arms; which will be repeated with equal sincerity to those who may chance to succeed us. The influence of the Dutch (and it would have been the same with any other European power) has certainly contributed to undermine the political consequence of Menangkabau, by giving countenance and support to its disobedient vassals; who in their turn have often experienced the dangerous effects of receiving favours from too powerful an ally. Pasaman, a populous country, and rich in gold, cassia, and camphor, one of its nearest provinces, and governed by a pang-lima from thence, now disclaims all manner of dependance. Its sovereignty after a struggle in which sixty of the Europeans lost their lives. At this period there was a great intercourse between Manancabo and Malacca, many vessels going yearly with gold, to purchase cotton goods and other merchandise. In ancient times the country was so rich in this metal, that several hundred weight (seis, sete, e mais candid, de que tres fazem hum mogo) were exported in one season. Vol. III. p. 178. Linschoten, 1601. “At Manancabo excellent poniards made, called cresces; best weapons of all the orient. Islands along the coast of Sumatra, called islands of Menancabo.” Argensola, 1609. “A vessel loaded with cresces manufactured at Menancabo and a great quantity of artillery; a species of warlike machine known and fabricated in Sumatra many years before they were introduced by Europeans.” Lancaster, 1602. “Menancabo lies eight or ten leagues inland of Priaman.” Best, 1613.

“A man arrived from Menangcabo at Ticoo, and brought news from Jambe.” Beaullieu, 1632. “Du coté du ponant après Padang suit le royaume de Manimcabo; puis celui d’Andripoura—Il y a (à Jambi) grand trafic d’or, qu’ils ont avec ceux de Manimcabo.” Vies des Gouverneurs Gen. Hollandois, 1763. Il est bon de remarquer ici que presque toute la côte occidentale avait été réduite par la flotte du Sieur Pierre de Bitter en 1664. L’année suivante, les habitans de Pauw massacrerent le Commissaire Gruis, &c.; mais après avoir vengé ce meurtre, & dissipé les revoltés en 1666, les Hollandois étoient restés les maîtres de toute cette étendue de côtes entre Sillebar & Baros, où ils établirent divers comptoirs, dont celui de Padang est le principal depuis 1667. Le commandant, qui y résidé, est en même temps Stadhoudier (Lieutenant) de l’Empereur de Maniringcabo, à qui la Compagnie a cédé, sous diverses restrictions & limitations, la souveraineté sur tous les peuples qui habitent le long du rivage.” &c.
Sumatra.

Sovereignty is divided between the two rajas of Sabluan and Kanali, who, in imitation of their former masters, boast an origin of high antiquity. One of them preserves as his sacred relic, the bark of a tree in which his ancestor was nursed in the woods, before the Pasaman people had reached their present polished state. The other, to be on a level with him, possesses the beard of a reverend predecessor (perhaps an anchorite), which was so bushy, that a large bird had built its nest in it. Raja Kanali supported a long war with the Hollanders, attended with many reverses of fortune.

Whether the three sultans maintain a struggle of hostile rivalship, or act with an appearance of concert, as holding the nominal sovereignty under a species of joint-regency, I am not informed, but each of them in the preamble of his letters assumes all the royal titles, without any allusion to competitors; and although their power and resources are not much beyond those of a common raja, they do not fail to assert all the ancient rights and prerogatives of the empire, which are not disputed so long as they are not attempted to be carried into force. Pompous dictatorial edicts are issued, and received by the neighbouring states (including the European chiefs of Padang), with demonstration of profound respect, but no farther obeyed than may happen to consist with the political interests of the parties to whom they are addressed. Their authority, in short, resembles not a little that of the sovereign pontiffs of Rome during the latter centuries, founded as it is in the superstition of remote ages; holding terrours over the weak, and contemned by the stronger powers. The district of Suruwasa, containing the site of the old capital, or Menaiqkabau proper, seems to have been considered by the Dutch as entitled to a degree of pre-eminence; but I have not been able to discover any marks of superiority or inferiority amongst them. In distant parts the schism is either unknown, or the three who exercise the royal functions are regarded as co-existing members of the same family, and their government, in the abstract, however insignificant in itself, is there an object of veneration. Indeed, to such an unaccountable excess is this carried, that every relative of the sacred family, and many who have no pretensions to it assume that character, are treated wherever they appear, not only with the most profound respect by the chiefs
chiefs who go out to meet them, fire salutes on their entering the dusuns, and allow them to level contributions for their maintenance; but by the country people with such a degree of superstitious awe, that they submit to be insulted, plundered, and even wounded by them, without making resistance, which they would esteem a dangerous profanation. Their appropriate title (not uncommon in other Malayan countries) is Iäng de per-tūan, literally signifying "he who ruleth."

A person of this description, who called himself Sri Ahmed Shah, heir to the empire of Menāvīgkabau, in consequence of some differences with the Dutch, came and settled amongst the English at Bencoolen in the year 1687, on his return from a journey to the southward as far as Lampong, and being much respected by the people of the country, gained the entire confidence of Mr. Bloom, the governor. He subdued some of the neighbouring chiefs who were disaffected to the English, particularly Raja mudo of Suīgei-lamo, and also a Jennang or deputy from the king of Bantam; he coined money, established a market, and wrote a letter to the East India Company promising to put them in possession of the trade of the whole island. But shortly afterwards a discovery was made of his having formed a design to cut off the settlement, and he was in consequence driven from the place. The records mention at a subsequent period, that the sultan of Indrapura was raising troops to oppose him. His titles.

The titles and epithets assumed by the sultans are the most extravagantly absurd that it is possible to imagine. Many of them descend to mere

* The following anecdote of one of these personages was communicated to me by my friend, the late Mr. Crisp. "Some years ago, when I was resident of Manna, there was a man who had long worked in the place as a cooley, when some one arrived from the northward, who happened to discover that he was an Iäng de per-tūan or relation of the imperial family. Immediately all the bazaar united to raise him to honour and independence; he was never suffered to walk without a high umbrella carried over him, was followed by numerous attendants, and addressed by the title of tuanku, equivalent to your highness. After this he became an intriguing, troublesome fellow in the Residency, and occasioned much annoyance. The prejudice in favour of these people is said to extend over all the islands to the eastward where the Malay tongue is spoken."
mere childishness; and it is difficult to conceive how any people, so far advanced in civilization as to be able to write, could display such evidences of barbarism. A specimen of a warrant of recent date, addressed to Tuanku Sin'gei-Pagu, a high-priest residing near Bencoolen, is as follows:

Three circular Seals with inscriptions in Arabic characters.

(Eldest brother)  
Sultan of Rum  
Key Dummul Alum.  
Maharaja Alif.

(Second brother)  
Sultan of China  
Nour Alum  
Maharaja Dempang or Dipang

(Youngest brother)  
Sultan of Menangkabau  
Aour Alum  
Maharaja Dirja or Durja

The sultan of Menangkabau whose residence is at Pagar-ruyong, who is king of kings; a descendant of raja Iskander zu'l-karnaini; possessed of the crown brought from heaven by the prophet Adam; of a third part of the wood kamat, one extremity of which is in the kingdom of Rūm and another in that of China; of the lance named lambing lambura ornamented with the beard of janūghi; of the palace in the city of Rūm, whose entertainments and diversions are exhibited in the month of zu'hlījah, and where all alims, fakiahs, and mulanakaris praise and supplicate Allah; possessor of the gold-mine named kudarat-kudarati, which yields pure gold of twelve carats, and of the gold named jati-jati which snaps the dalik wood; of the sword named churak-simandang-giri, which received one hundred and ninety gaps in conflict with the fiend Si Kati-muno, whom it slew; of the kris formed of the soul of steel, which expresses an unwillingness at being sheathed and shews itself pleased when drawn; of a date coëval with the creation; master of fresh water in the ocean, to the extent of a day's sailing; of a lance formed of a twig of iju; the sultan who receives his taxes in gold by the lessong measure; whose betel-stand
betel-stand is of gold set with diamonds; who is possessor of the web named saṅgsista kala, which weaves itself and adds one thread yearly, adorned with pearls, and when that web shall be completed the world will be no more; of horses of the race of sorimborani, superior to all others; of the mountain Si guntang-guntang, which divides Palembang and Jambi, and of the burning mountain; of the elephant named Hasti Dewah; who is viceregent of heaven; sultan of the golden river; lord of the air and clouds; master of a ballei whose pillars are of the shrub jalatang; of gandarangs (drums) made of the hollow stems of the diminutive plants palut and silosuri; of the anchor named paduka jati employed to recover the crown which fell into the deep sea of Kulzum; of the gong that resounds to the skies; of the buffalo named Si Binuwang Sati, whose horns are ten feet asunder; of the unconquered cock, Sen-gunani; of the coconut-tree which from its amazing height and being infested with serpents and other noxious reptiles, it is impossible to climb; of the blue champaka flower, not to be found in any other country than his (being yellow elsewhere); of the flowering shrub named Sri menjeri, of ambrosial scent; of the mountain on which the celestial spirits dwell; who when he goes to rest wakes not until the gandarang nobat sounds; He the sultan Sri Maharaja Durja furthermore declares, &c.

2 X 2

* The following Letter from the sultan of Menagkabau to the father of the present sultan of Moco-moco, and apparently written about fifty years ago, was communicated to me by Mr. Alexander Dalrymple, and though it is in part a repetition, I esteem it too curious to hesitate about inserting it. The style is much more rational than that of the foregoing.

“Praised be Almighty God! Sultan Gagar Alum the great and noble King, whose extensive power reacheth unto the limits of the wide ocean; unto whom God grants whatever he desires, and over whom no evil spirit, nor even Satan himself has any influence; who is invested with an authority to punish evil-doers; and has the most tender heart in the support of the innocent; has no malice in his mind, but preserveth the righteous with the greatest reverence, and nouriseth the poor and needy, feeding them daily from his own table. His authority reacheth over the whole universe, and his candour and goodness is known to all men. (Mention made of the three brothers.) The ambassador of God and his prophet Mahomet; the beloved of mankind; and ruler of the island called Percho. At the time
SUMATRA.

Probably no records upon earth can furnish an example of more unintelligible jargon; yet these attributes are believed to be indisputably true, by the Malays and others residing at a distance from his immediate dominions, time God made the heavens, the earth, the sun, the moon, and even before evil spirits were created, this sultan Gagar Alam had his residence in the clouds; but when the world was habitable, God gave him a bird called Hocinet, that had the gift of speech; this he sent down on earth, to look out for a spot where he might establish an inheritance, and the first place he lighted upon was the fertile island of Lankapura, situated between Palembang and Jambi, and from thence sprang the famous kingdom of Manancabou, which will be renowned and mighty until the Judgment Day.

"This Maha Raja Durja is blessed with a long life, and an uninterrupted course of prosperity, which he will maintain in the name, and through the grace of the holy prophet, to the end that God's divine Will may be fulfilled upon earth. He is endowed with the highest abilities, and the most profound wisdom and circumspection in governing the many tributary kings and subjects. He is righteous and charitable, and preserveth the honour and glory of his ancestors. His justice and clemency are felt in distant regions, and his name will be revered until the last day. When he openeth his mouth he is full of goodness, and his words are as grateful as rose water to the thirsty. His breath is like the soft winds of the heavens, and his lips are the instruments of truth; sending forth perfumes more delightful than benjamin or myrrh. His nostrils breathe ambrogrease and musk; and his countenance has the lustre of diamonds. He is dreadful in battle, and not to be conquered, his courage and valour being matchless. He, the sultan Maha Raja Durja, was crowned with a sacred crown from God; and possesses the wood called Kamat, in conjunction with the emperors of Rome and China. (Here follows an account of his possessions nearly corresponding to those above recited.)

"After this salutation, and the information I have given of my greatness and power, which I attribute to the good and holy prophet Mahomet, I am to acquaint you with the commands of the sultan whose presence bringeth death to all who attempt to approach him without permission; and also those of the sultan of Indrapura who has four breasts. This friendly sheet of paper is brought from the two sultans above named, by their bird anggas, unto their son, sultan Gandam Shah, to acquaint him with their intention, under this great seal, which is, that they order their son sultan Gandam Shah to oblige the English Company to settle in the district called Biangmur, at a place called the "field of sheep," that they may not have occasion to be ashamed at their frequent refusal of our goodness, in permitting them to trade with us and with our subjects; and that in case he cannot succeed in this affair, we hereby advise him, that the ties of friendship subsisting between us and our son is broken; and we direct that he send us an answer immediately, that we may know the result—for all this island is our own." It is difficult to determine whether the preamble, or the purport of the letter be the more extraordinary.
dominions, who possess a greater degree of faith than wit; and with this addition, that he dwells in a palace without covering, free from inconvenience. It is at the same time but justice to these people to observe that, in the ordinary concerns of life, their writings are as sober, consistent, and rational as those of their neighbours.

The seals prefixed to the warrant are, beside his own and that of the emperor of China, whose consequence is well known to the inhabitants of the eastern islands, that of the sultan of Rūm, by which is understood in modern times, Constantinople, the seat of the emperor of the Turks, who is looked up to by Mahometans, since the ruin of the khalīfat, as the head of their religion; but I have reason to think that the appellation of Rūmi, was at an earlier period given by oriental writers to the subjects of the great Turkoman empire of the Seljuks, whose capital was Iconium or Kuniyah in Asia minor, of which the Ottoman was a branch. This personage he honours with the title of his eldest brother, the descendant of Iskander the two-horned, by which epithet the Macedonian hero is always distinguished in eastern story, in consequence, as may be presumed, of the horned figure on his coins, which must long have circulated in Persia and Arabia. Upon the obscure history of these supposed brothers some light is thrown by the following legend communicated to me as the belief of the people of Johor. "It is related that Iskander dived into the sea, and there married a daughter of the king of the ocean, by whom he had three sons, who, when they arrived at manhood, were sent by their mother to the residence of their father. He gave them a makuta or crown, and ordered them to find kingdoms where they should establish themselves. Arriving in the straits of Siṉa-pura they determined to try whose head the crown fitted. The eldest trying first could not lift it to his head. The second the same. The third had nearly effected it, when it fell from his hand into the sea. After this the eldest turned to the west and became king of Rome, the second to the east and became king of China. The third remained at Johor.

* See a beautiful engraving of one of these coins preserved in the Bodleian collection, Oxford, prefixed to Dr. Vincent's Translation of the Voyage of Nearchus, printed in 1809.
Sumatra. At this time *Pulo Percha* (Sumatra) had not risen from the waters. When it began to appear, this king of Johor, being on a fishing party, and observing it oppressed by a huge snake named *Si Kati-muno*, attacked the monster with his sword called *Simandang-giri*, and killed it, but not till the sword had received one hundred and ninety notches in the encounter. The island being thus allowed to rise, he went and settled by the burning mountain, and his descendants became kings of *Menangkabau*. This has much the air of a tale invented by the people of the peninsula to exalt the idea of their own antiquity at the expense of their Sumatran neighbours. The blue champaka-flower of which the sultan boasts possession, I conceive to be an imaginary and not an existent plant. The late respected Sir W. Jones, in his Botanical Observations printed in the Asiatic Res. Vol. IV. suspects that by it must be meant the *Kämpferia Bluchampac*, a plant entirely different from the michelia; but as this supposition is built on a mere resemblance of sounds, it is necessary to state that the Malayan term is *champaka biru*, and that nothing can be inferred from the accidental coincidence of the Sanskrit word *bhu*, signifying "ground," with the English term for the blue colour.

Ceremonies. With the ceremonies of the court we are very imperfectly acquainted. The royal salute is one gun; which may be considered as a refinement in ceremony; for as no additional number could be supposed to convey an adequate idea of respect, but must, on the contrary, establish a definite proportion between his dignity and that of his nobles, or of other princes, the sultan choses to leave the measure of his importance indefinite by this policy and save his gunpowder. It must be observed, that the Malays are in general extremely fond of the parade of firing guns, which they never neglect on high days, and on the appearance of the new moon, particularly that which marks the commencement and the conclusion of their *puasa* or annual fast. Yellow being esteemed, as in China, the royal colour, is said to be constantly, and exclusively worn by the sultan and his household. His usual present on sending an embassy, (for no Sumatran, or other oriental, has an idea of making a formal address, on any occasion, without a present in hand, be it never
so trifling) is a pair of white horses; being emblematic of the purity of his character and intentions.

The immediate subjects of this empire, properly denominated Malays, are all of the Mahometan religion, and in that respect distinguished from the generality of inland inhabitants. How it has happened that the most central people of the island should have become the most perfectly converted, is difficult to account for; unless we suppose that its political importance, and the richness of its gold trade, might have drawn thither its pious instructors, from temporal as well as spiritual motives. Be this as it may, the country of Menarikhabau is regarded as the supreme seat of civil and religious authority in this part of the East, and next to a voyage to Mecca, to have visited its metropolis, stamps a man learned, and confers the character of superior sanctity. Accordingly the most eminent of those who bear the titles of imam, mulana, khatib, and pandita, either proceed from thence, or repair thither for their degree, and bring away with them a certificate or diploma from the sultan or his minister.

In attempting to ascertain the period of this conversion, much accuracy is not to be expected; the natives are either ignorant on the subject, or have not communicated their knowledge, and we can only approximate the truth, by comparing the authorities of different old writers. Marco Polo, the Venetian traveller, who visited Sumatra under the name of Java minor (see p. 6.) says that the inhabitants of the sea-shore were addicted to the Mahometan law, which they had learned from Saracen merchants. This must have been about the year 1290, when, in his voyage from China, he was detained for several months at a port in the Straits, waiting the change of the monsoon; and though I am scrupulous of insisting upon his authority (questioned as it is), yet in a fact of this nature he could scarcely be mistaken, and the assertion corresponds with the annals of the princes of Malacca, which state, as we have seen above, that sultan Muhammed Shah, who reigned from 1276 to 1333, was the first royal convert. John De Barros, a Portuguese historian of great industry, says, that according to the tradition of the inhabitants, the city of Malacca was founded about the year 1260, and that...
about 1400 the Mahometan faith had spread considerably there, and extended itself to the neighbouring islands. Diego do Couto, another celebrated historian, who prosecuted his inquiries in India, mentions the arrival at Malacca of an Arabian priest, who converted its monarch to the faith of the khalifs, and gave him the name of Shah Muhammed, in the year 1384. This date, however, is evidently incorrect, as that king's reign was earlier by fifty years. Corneille le Brun was informed by the king of Bantam, in 1706, that the people of Java were made converts to that sect about three hundred years before. Valentyn states, that Sheik Mulana, by whom this conversion was effected in 1406, had already disseminated his doctrine at Achê, Pasê (places in Sumatra) and Johor. From these several sources of information, which are sufficiently distinct from each other, we may draw this conclusion, that the religion, which sprang up in Arabia in the seventh century, had not made any considerable progress in the interior of Sumatra earlier than the fourteenth, and that the period of its introduction, considering the vicinity to Malacca, could not be much later. I have been told, indeed, but cannot vouch for its authenticity, that in 1782 these people counted 670 years from the first preaching of their religion, which would carry the period back to 1112. It may be added, that in the island of Ternate, the first Mahometan prince reigned from 1466 to 1486; that Francis Xavier, a celebrated Jesuit missionary, when he was at Amboina in 1546, observed the people then beginning to learn to write from the Arabians; that the Malays were allowed to build a mosque at Goak in Makasar subsequently to the arrival of the Portuguese in 1512; and that in 1603 the whole kingdom had become Mahometan. These islands lying far to the eastward, and being of less considerable account in that age than subsequent transactions have rendered them, the zeal of religious adventurers did not happen to be directed thither so soon as to the countries bordering on the sea of India.

By some it has been asserted, that the first sultan of Menangkabau was a Xerif from Mecca, or descendant of the khalifs, named Padjuka Sri Sultan Ibrahim, who, settling in Sumatra, was received with honour by the princes of the country, Perapati-si-batang and his brother, and acquired sovereign authority. They add, that the sultans who now reside at
at Pagar-ruyong and at Suruwasa are lineally descended from that Xerif; whilst he who resides at Sungei Trap, styled Datu Bandhara putih, derives his origin from Perapati. But to this supposition there are strong objections. The idea so generally entertained by the natives, and strengthened by the glimmering lights that the old writers afford us, bespeaks an antiquity to this empire that stretches far beyond the probable era of the establishment of the Mahometan religion in the island. Radin Tamaniggun, son of a king of Madura, a very intelligent person, and who as a prince himself was conversant with these topics, positively asserted to me, that it was an original Sumatran empire, antecedent to the introduction of the Arabian faith; instructed, but by no means conquered, as some had imagined, by people from the peninsula. So memorable an event as the elevation of a Xerif to the throne would have been long preserved by annals or tradition, and the sultan in the list of his titles would not fail to boast of this sacred extraction from the prophet, to which, however, he does not at all allude; and to this we may add, that the superstitious veneration attached to the family extends itself not only where Mahometanism has made a progress, but also among the Battas and other people still unconverted to that faith; with whom it would not be the case, if the claim to such respect was grounded on the introduction of a foreign religion which they have refused to accept.

Perhaps it is less surprising, that this one kingdom should have been completely converted, than that so many districts of the island should remain to this day without any religion whatever. It is observable, that a person of this latter description, coming to reside among the Malays, soon assimilates to them in manners, and conforms to their religious practices. The love of novelty, the vanity of learning, the fascination of ceremony, the contagion of example, veneration for what appears above his immediate comprehension, and the innate activity of man's intellectual faculties, which, spurred by curiosity, prompts him to the acquisition of knowledge, whether true or false—all conspire to make him embrace a system of belief, and scheme of instruction, in which there is nothing that militates against prejudices already imbibed. He relinquishes
relinquishes no favourite ancient worship to adopt a new; and is manifestly a gainer by the exchange, when he barthers, for a paradise and eternal pleasures, so small a consideration as the flesh of his foreskin.

The Malays, as far as my observation went, did not appear to possess much of the bigotry so commonly found amongst the western Mahometans, or to shew antipathy to or contempt for unbelievers. To this indifference is to be attributed my not having positively ascertained whether they are followers of the sunni or the shiah sect, although from their tolerant principles and frequent passages in their writings in praise of Ali, I conclude them to be the latter. Even in regard to the practice of ceremonies, they do not imitate the punctuality of the Arabs and others of the mussulman faith. Excepting such as were in the orders of the priesthood, I rarely noticed persons in the act of making their prostrations. Men of rank, I am told, have their religious periods, during which they scrupulously attend to their duties, and refrain from gratifications of the appetite, together with gambling and cockfighting; but these are not long nor very frequent. Even their great Fast or puasa (the ramadan of the Turks) is only partially observed. All those who have a regard for character fast more or less, according to the degree of their zeal or strength of their constitutions; some for a week, others for a fortnight; but to abstain from food and betel, whilst the sun is above the horizon, during the whole of a lunar month, is a very rare instance of devotion.

Malayan literature consists chiefly of transcripts and versions of the koran, commentaries on the mussulman law, and historic tales both in prose and verse, resembling in some respect our old romances. Many of these are original compositions, and others are translations of the popular tales current in Arabia, Persia, India, and the neighbouring island of Java, where the Hindu languages and mythology appear to have made, at a remote period, considerable progress. Among several works of this description I possess their translation (but much compressed) of the Ramayan, a celebrated Sanskrit poem, and also of some of the Arabian stories lately published in France as a Continuation of the
"Thousand and one Nights," first made known to the European world by M. Galland. If doubts have been entertained of the authenticity of these additions to his immortal collection, the circumstance of their being (however partially) discovered in the Malayan language, will serve to remove them. Beside these they have a variety of poetic works, abounding rather with moral reflections and complaints of the frowns of fortune or of ill-requited love, than with flights of fancy. The pantun or short proverbial stanza has been already described. They are composed in all parts of the island, and often extempore; but such as proceed from Menangkabau, the most favoured seat of the Muses, are held in the first esteem. Their writing is entirely in the modified Arabic character, and upon paper previously ruled by means of threads drawn tight and arranged in a peculiar manner.

The arts in general are carried, among these people, to a greater degree of perfection, than by the other natives of Sumatra. The Malays are the sole fabricators of the exquisite gold and silver filagree, the manufacture of which has been particularly described: in the country of Menangkabau they have, from the earliest times, manufactured arms for their own use and to supply the northern inhabitants of the island, who are the most warlike; and which trade they continue to this day, smelting, forging, and preparing, by a process of their own, the iron and steel for this purpose; although much is at the same time purchased from Europeans.\(^{a}\) The use of cannon in this and other parts of India is mentioned by the oldest Portuguese historians, and it must consequently have been known there before the discovery of the passage by the Cape of Good Hope. Their guns are those pieces called match-locks, the improvement of springs and flints not being yet adopted by them; the barrels are well tempered, and of the justest bore, as is evident from the excellence of their aim, which they always take by lowering, instead of raising the muzzle of the piece to the object. They are wrought by rolling

\(^{a}\) The principal iron mines are at a place called Padang Luar, where the ore is sold at the rate of half a fanam or forty eighth part of a dollar for a man's load, and carried to another place in the Menangkabau country called Selimpuwong, where it is smelted and manufactured.
ling a flatted bar of iron, of proportionate dimensions, spirally round a circular rod, and beating it till the parts of the former unite; which method seems preferable, in point of strength, to that of folding and soldering the bar longitudinally. The art of boring may well be supposed unknown to these people. Firelocks are called by them snapang, from the Duch name. Gunpowder they make in great quantities, but either from the injudicious proportion of the ingredients in the composition, or the imperfect granulation, it is very defective in strength. The tombak, lambing, and kujur or kunjur are names for weapons of the lance or spear kind; the pedang, rudus, pamandap, and kulewang are of the sword kind, and slung at the side; the siwar is a small instrument of the nature of a stiletto, chiefly used for assassination; and the kris is a species of dagger of a particular construction, very generally worn, being stuck in front through the folds of a belt that goes several times round the body. The blade is about fourteen inches in length, not straight, nor uniformly curved, but waving in and out, as we see depicted the flaming swords that guarded the gates of paradise; which probably may render a wound given with it the more fatal. It is not smooth or polished like those of our weapons, but by a peculiar process made to resemble a composition, in which veins of a different metal are apparent. This damasking (as I was informed by the late Mr. Boulton) is produced by beating together steel and iron wire whilst in a state of half fusion, and eating them with acids, by which the softest part is the most corroded; the edges being of pure steel. Their temper is uncommonly hard. The head or haft is either of ivory, the tooth of the duyong (sea cow), that of the hippopotamus, the snout of the ikan layer (voilier), of black coral, or of fine grained wood. This is ornamented with gold or a mixture of that and copper, which they call swasa, highly polished and carved into curious figures, some of which have the beak of a bird, with the arms of a human creature, and bear a resemblance to the Egyptian Isis. The sheath also is formed of some beautiful species of wood, hollowed out, with a neat lacing of split rattan, stained red round the lower parts; or sometimes it is plated with gold. The value of a kris, is supposed to be enhanced in proportion to the number of persons it has slain. One that has been the instrument of much bloodshed
shed is regarded with a degree of veneration as something sacred. The
horro... of effecting mischief. Other circumstances also contribute to
give them celebrity, and they are distinguished by pompous names.
Some have a cushion by their bedside on which is placed their
favourite weapon. I have a manuscript treatise on *krises*, accompanied
with drawings, describing their imaginary properties and value, estimated
at the price of one or more slaves. The abominable custom of poisoning
them, though much talked of, is rarely practised, I believe, in modern
times. They are frequently seen rubbing the blades with lime-juice,
which has been considered as a precaution against danger of this kind,
but it is rather for the purpose of removing common stains, or of impro-
v...
dang have often found them troublesome enemies, from their numbers, and been obliged to secure themselves within their walls. Between the Menangkabau people, those of Rau or Aru, and the Achinese, settled at Natal, wars used to be incessant until they were checked by the influence of our authority at that place. The factory itself was raised upon one of the breast-works thrown up by them for defence, of which several are to be met with in walking a few miles into the country, and some of them very substantial. Their campaigns, in this petty warfare, were carried on very deliberately. They made a regular practice of commencing a truce at sunset, when they remained in mutual security, and sometimes agreed that hostilities should take place only between certain hours of the day. The English resident, Mr. Carter, was frequently chosen their umpire, and upon these occasions used to fix in the ground his golden headed cane, on the spot where the deputies should meet and concert terms of accommodation; until at length the parties, grown weary of their fruitless contests, resolved to place themselves respectively under the dependance and protection of the company. The fortified villages, in some parts of the country named dusun, and in others kampung, are here, as on the continent of India, denominated kota or forts, and the districts are distinguished from each other by the number of confederated villages they contain.

Government. The government, like that of all Malayan states, is founded on principles entirely feudal. The prince is styled raja, maha-raja, iang de pertuan, or sultan; the nobles, have the appellation of orang kaya or datu, which properly belongs to the chiefs of tribes, and implies their being at the head of a numerous train of immediate dependants or vassals, whose service they command. The heir-apparent has the title of raja muda. From amongst the orang kayas the sultan appoints the officers of state, who as members of his council are called mantri; and differ in number and authority, according to the situation and importance of the kingdom. Of these the first in rank, or prime minister, has the appellation of perdana mantri, manāgko bumi, and not seldom, however anomalously, maharaja. Next to him, generally, is the bandhara, treasurer or high steward; then the laksamana and tamanāggung, commanders in chief
by sea and land, and lastly the shahbandara, whose office it is to superintend the business of the customs (in sea-port towns) and to manage the trade for the king. The governors of provinces are named panglima, the heads of departments pangulu. The ulubalang are military officers, forming the body-guard of the sovereign, and prepared on all occasions to execute his orders. From their fighting singly, when required, in the cause of the prince or noble who maintains them, the name is commonly translated "champion"; but when employed by a weak, but arbitrary and cruel prince, to remove by stealth, obnoxious persons whom he dares not to attack openly, they may be compared more properly to the Ismaelians or Assassins, so celebrated in the history of the Crusades, as the devoted subjects of the Sheikh al-jabal or "Old man of the mountain," as this chief of Persian Irak is vulgarly termed. I have not reason, however, to believe that such assassinations are by any means frequent. The immediate vassals of the king are called amba raja; and for the subjects in general the word rayet has been adopted. Beside those above-named, there is a great variety of officers of government of an inferior class; and even among the superior there is not, at every period, nor in every Malayan state, a consistent uniformity of rank and title. The smaller Malayan establishments are governed by their datus or heads of tribes, of whom there are generally four; as at Bencoolen (properly Benigkaulu) near to which the English settlement of Fort Marlborough is situated, and where Fort York formerly stood. These are under the protection or dominion of two native chiefs or princes, the panigerans of Sunigei-lamo and Sunigei-etam, the origin of whose authority has been already explained (p. 212). Each of these has possessions on different parts of the river, the principal sway being in the hands of him of the two who has most personal ability. They are constant rivals, though living upon familiar terms, and are only restrained from open war by the authority of the English. Limun likewise, and the neighbouring places of Batang-asei and Pakalang-jambu, near the sources of Jambi river, where gold is collected, and carried chiefly to Bencoolen and the settlement of Laye, where I had opportunities of seeing the traders, are each governed by four datus, who, though not immediately nominated by the sultan, are confirmed by, and pay tribute to, him. The first of these, whose situation is most southerly, receive also an investiture (baju, garment,
ment, and destar, turband), from the sultan of Palembang; being a po-
litic measure adopted by these merchants, for the convenience attending
it in their occasional trading concerns with that place.

Hot springs. At Prianggan, near Gunong-berapi, are several hot mineral springs,
called in the Malayan map already mentioned, panchuran tujuh or the
seven conduits, where the natives, from time immemorial, have been in
the practice of bathing; some being appropriated to the men, and others
to the women; with two of cold water, styled the king’s. It will be
recollected, that in ancient times this place was the seat of government.
Near to these springs is a large stone or rock of very hard substance,
one part of which is smoothed to a perpendicular face of about ten or
twelve feet long and four high, on which are engraved characters sup-
posed to be European, the space being entirely filled with them and
certain chaps or marks at the corners. The natives presume them to be
Dutch, but say that the latter do not resemble the present mark of the
Company. There is some appearance of the date 1100. The informant
(named Raja Intan), who had repeatedly seen and examined it, added,
that M. Palm, governor of Padang, once sent Malays, with paper and
paint, to endeavour to take off the inscription, but they did not succeed;
and the Dutch, whose arms never penetrated to that part of the coun-
try, are ignorant of its meaning. It is noticed in the Malayan map.
Should it prove to be a Hindu monument, it will be thought curious.
Among the earliest dismemberments of the Menangkabau empire, was the establishment of Indrapura as an independent kingdom. Though now, in its turn, reduced to a state of little importance, it was formerly powerful, in comparison with its neighbours, and of considerable magnitude, including Anak-Sungei, and extending as far as Kattaun. Some idea of its antiquity may be formed from an historical account given by the Sultan of Bantam to the intelligent traveller Corneille le Brun, in which it is related, that the son of the Arabian prince who first converted the Javans to the religion of the Prophet, about the year 1400, having obtained for himself the sovereignty of Bantam, under the title of pangeran, married the daughter of the raja of Indrapura, and received as her portion the country of the Stillabares, a people of Banca-houlou. Upon this cession appears to be grounded the modern claim of the sultan to this part of the coast, which, previously to the treaty of Paris in 1763, was often urged by his sovereigns, the Dutch East India Company. His dominion is said, indeed, to have extended from the southward as far as Urei river, and at an early period, to Retta or Ayer Etam, between Ipu and Moco-moco; but that the intermediate space was ceded by him to the raja of Indrapura, in satisfaction for the murder of a prince, and that a small annual tax was laid by the latter on the Anak-sungei people, on account of the same murder (being the fourth part of a dollar, a bamboo of rice, and a fowl, from each village), which is now paid to the sultan of Moco-moco. In the year 1682 the district of Ayer Aji threw off its dependance on Indrapura. In 1696 Raja Pasisir Barat, under the influence of the Dutch, was placed on the throne, at the age of six years, and his grandfather appointed guardian; but in 1701, in consequence of a quarrel with his protectors, the European settlers were massacred. This was the occasion of a destructive war, in the event of which the raja and his mantris were obliged to fly, and the country was nearly depopulated. In 1705 he was reinstated, and reigned till about 1732.
1732; but the kingdom never recovered the shock it had received, and dwindled into obscurity. Its river, which descends from the mountains of Korinchi, is considered as one of the largest in the southern part of the west-coast, and is capable of admitting sloops. The country formerly produced a large quantity of pepper, and some gold was brought down from the interior, which now finds another channel. An English factory was established there about the year 1684, but never became of any importance.

From the ruins of Indrapura has sprung the kingdom of Anak-sungei, extending, along the sea-coast, from Manjuta river to that of Urei. Its chief bears the title of sultan, and his capital, if such places deserve the appellation, is Moco-moco. A description of it will be found at p. 319. Although the government is Malayan, and the ministers of the sultan are termed mantri (a title borrowed from the Hindus) the greatest part of the country dependant on it is inhabited by the original dusun people, and accordingly their proper chiefs are styled proatlin, who are obliged to attend their prince at stated periods, and to carry to him their contribution or tax. His power over them, however, is very limited.

The first monarch of this new kingdom was named sultan Gulemat, who, in 1695, established himself at Manjuta, by the assistance of the English, in consequence of a revolution at Indrapura, by which the prince who had afforded them protection on their first settling, was driven out through the intrigues, as they are termed, of the Dutch. It was a struggle, in short, between the rival Companies, whose assistance was courted by the different factions, as it happened to suit their purpose, or who, becoming strong enough to consider themselves as principals, made the native chiefs the tools of their commercial ambition. In the year 1717 Gulemat was removed from the throne by an assembly of the chiefs styling themselves the mantris of Lima-kota and proattins of Anak-sungei, who set up a person named Raja Kechil-besär in his room, appointing, at the same time, as his minister and successor, Raja Gandam Shah, by whom, upon his accession in 1728, the seat of government was removed from Manjuta to Moco-moco. He was father of sultan Pasisir Barat shah mualim shah, still reigning in the year 1780, but harassed
harassed by the frequent rebellions of his eldest son. The space of time occupied by the reigns of these two sovereigns is extraordinary, when we consider that the former must have been at man's estate when he became minister or assessor in 1717. Nor is it less remarkable, that the son of the deposed sultan Gulemat, called sultan Avel ed-din, was also living, at Tappanuli, about the year 1780, being then supposed ninety years of age. He was confined as a state prisoner at Madras during the government of Mr. Morse, and is mentioned by Capt. Forrest (Voyage to the Mergui Archipelago, p. 57) as uncle to the king of Achin, who reigned in 1784. The first English settlement at Moco-moco was formed in 1717.

Passamman was the most northern of the provinces immediately dependant on Menangkabau, and afterwards, together with Priaman and many other places on the coast, fell under the dominion of the kings of Achin. It is now divided into two petty kingdoms, each of which is governed by a raja and fourteen pangalis. Formerly it was a place of considerable trade, and beside a great export of pepper, received much fine gold, from the mountains of the Rau country, lying about three days' journey inland. The inhabitants of these are said to be Battas converted to Mahometanism, and mixed with Malays. They are governed by datus. The peculiarity of dress remarked of the Korinchi people is also observable here, the men wearing drawers, that reach just below the calf, having one leg of red and the other of white or blue cloth, and the buju or garment also party-coloured. The greater part of the gold they collect finds its way to Patapahan on the river of Siak, and from thence to the eastern side of the island and straits of Malacca. The Agam tribe adjoining to the Rau, and connecting to the southward with Menangkabau, differs little from Malays, and is likewise governed by datus.

The great river of Siak has its source in the mountains of the Menangkabau country, and empties itself nearly opposite to Malacca, with which place it formerly carried on a considerable trade. From the Dutch charts we had a general knowledge of its course as far as a place called Mandau or Mandol, as they write the name, and where they had a small
a small establishment, on account of its abounding with valuable ship-timber. A recent survey executed by Mr. Francis Lynch, under the orders of the government of Pulo Pinang, has made us more particularly acquainted with its size, its advantages, and defects. From the place where it discharges itself into the straits of Kampan or Bengalis, to the town of Siak, is, according to the scale of his chart, about sixty-five geographical miles, and from thence to a place called Pakan bharn or New-market, where the survey discontinues, is about one hundred more. The width of the river is in general from about three quarters to half a mile, and its depth from fifteen to seven fathoms; but on the bar, at low water, spring-tides, there are only fifteen feet, and several shoals near its mouth. The tides rise about eleven feet at the town, where, at full and change, it is high water at nine a.m. Not far within the river is a small island on which the Dutch had formerly a factory. The shores are flat on both sides to a considerable distance up the country, and the whole of the soil is probably alluvial; but about an hundred and twenty-five or thirty miles up, Mr. Lynch marks the appearance of high land, giving it the name of Princess Augusta Sophia hill, and points it out as a commanding situation for a settlement. He speaks in favourable terms of the facility with which ship timber of any dimensions or shape may be procured and loaded. Respecting the size or population of the town, no information is given. The government of it was (in October, 1808) in the hands of the Tuan ku Pasigeran, brother to the Raja, who, in consequence of some civil disturbance, had withdrawn to the entrance of the river. His name is not mentioned; but from the Transactions of the Batavian Society we learn that the prince who reigned about the year 1780, was Raja Ismaël, “one of the greatest pirates in those seas.” The maritime power of the kingdom of Siak has always been considerable, and in the history of the Malayan states we repeatedly read of expeditions fitted out from thence making attacks upon Johor, Malacca, and various other places on the two coasts of the peninsula. Most of the neighbouring states (or rivers) on the eastern coast of Sumatra, from Langat to Jamby, are said to have been brought, in modern times, under its subjection.

The trade is chiefly carried on by Kling vessels, as they are called, from
from the coast of Coromandel, which supply cargoes of piece-goods, and also raw silk, opium, and other articles, which they provide at Pinang or Malacca; in return for which they receive gold, wax, sago, salted fish, and fish-roe, elephants' teeth, gambir, camphor, rattans, and other canes. According to the information of the natives, the river is navigable for sloops to a place called Panti Chermin, being eight days' sail, with the assistance of the tide, and within half a day's journey, by land, of another named Patapahan, which boats also, of ten to twenty tons, reach in two days. This is a great mart of trade with the Menangkabau country, whither its merchants resort with their gold. Pakan-bharu, the limit of Mr. Lynch's voyage, is much lower down, and the above-mentioned places are consequently not noticed by him. The Dutch Company procured annually from Siak, for the use of Batavia, several rafts of spars for masts, and if the plan of building ships at Pinang should be encouraged, large supplies of frame-timber for the purpose may be obtained from this river, provided a sense of interest shall be found sufficiently strong to correct or restrain the habits of treachery and desperate enterprise for which these people have in all ages been notorious.

The river Rakan, to the northward of Siak, by much the largest in the island, if it should not rather be considered as an inlet of the sea, takes its rise in the Rau country, and is navigable for sloops to a great distance from the sea; but vessels are deterred from entering it by the rapidity of the current, or more probably the reflux of the tide, and that peculiar swell known in the Ganges and elsewhere by the appellation of the bore. That of Kampar, to the southward, is said by the natives to labour under the same inconvenience, and Mr. Lynch was informed that the tides there rise from eighteen to twenty-four feet. If these circumstances render the navigation dangerous, it appears difficult to account for its having been a place of considerable note at the period of the Portuguese conquest of Malacca, and repeatedly the scene of naval actions with the fleets of Achin, whilst Siak, which possesses many natural advantages, is rarely mentioned. In modern times it has been scarcely at all known to Europeans, and even its situation is doubtful.
The river of Indragiri is said by the natives to have its source in a lake of the Menangkabau country, from whence it issues by the name of Ayer Ambelan. Sloops tide it up for five or six weeks (as they assert) anchoring as the ebb begins to make. From a place called Lubok ramo-ramo they use boats of from five to twenty tons, and the smaller sort can proceed until they are stopped by a fall or cascade at Seluka, on the borders of Menangkabau. This extraordinary distance to which the influence of the tides extend, is a proof of the absolute flatness of the country through which these rivers take the greater part of their course.

Jambi river has its principal source in the Limun country. Although of considerable size, it is inferior to Siak and Indragiri. At an early stage of European commerce in these parts it was of some importance, and both the English and Dutch had factories there; the former on a small island near the mouth, and the latter at some distance up the river. The town of Jambi is situated at the distance of about sixty miles from the sea, and we find in the work of the historian, Faria y Sousa, that in the year 1629, a Portuguese squadron was employed twenty-two days in ascending the river, in order to destroy some Dutch ships which had taken shelter near the town. Lionel Wafer, who was there in 1678 (at which time the river was blockaded by a fleet of praus from Johor) makes the distance an hundred miles. The trade consists chiefly in gold-dust, pepper, and canes, but the most of what is collected of the first article proceeds across the country to the western coast, and the quality of the second is not held in esteem. The port is therefore but little frequented by any other than native merchants. Sometimes, but rarely, a private trading ship from Bengal endeavours to dispose of a few chests of opium in this, or one of the other rivers; but the masters scarcely ever venture on shore, and deal with such of the Malays as come off to them, at the sword point; so strong is the idea of their treacherous character.

The kingdom of Palembang is one of considerable importance, and its river ranks amongst the largest in the island. It takes its rise in the district of Musi, immediately at the back of the range of hills visible from Bencoolen, and on that account has the name of Ayer Musi in the early part of its course, but in the lower, is more properly named the Tatong.

Opposite
SUMATRA.

Opposite to the city of Palembang and the Dutch Company's factory it is upwards of a mile in breadth, and is conveniently navigated by vessels whose draft of water does not exceed fourteen feet. Those of a larger description have been carried thither for military purposes (as in 1660, when the place was attacked and destroyed by the Hollanders) but the operation is attended with difficulty on account of numerous shoals. The port is much frequented by trading vessels, chiefly from Java, Madura, Balli, and Celebes, which bring rice, salt, and cloths the manufacture of those islands. With opium, the piece-goods of the west of India, and European commodities, it is supplied by the Dutch from Batavia, or by those who are termed interlopers. These in return receive pepper and tin, which, by an old agreement made with the sultan, and formally renewed in 1777, are to be exclusively delivered to the Company at stipulated prices, and no other Europeans are to be allowed to trade or navigate within his jurisdiction. In order to enforce these conditions, the Dutch are permitted to maintain a fort on the river with a garrison of fifty or sixty men (which cannot be exceeded without giving umbrage), and to keep its own cruizers to prevent smuggling. The quantity of pepper thus furnished was from one to two millions of pounds per annum. Of tin the quantity was about two millions of pounds, one third of which was shipped (at Batavia) for Holland, and the remainder sent to China. It has already been stated, that this tin is the produce of the island of Banīka, situated near the mouth of the river, which may be considered as an entire hill of tin-sand. The works, of which a particular account is given in Vol. III. of the Batav. Trans. are entirely in the hands of Chinese settlers. In the year 1778 the Company likewise received thirty-seven thousand bundles of rattans.

The lower parts of the country of Palembang towards the sea-coast are described as being flat marshy land, and, with the exception of some few tracts, entirely unfit for the purposes of cultivation. It is generally understood to have been all covered by the sea in former ages; not only from its being observed that the strand yearly gains an accession, but also that upon digging the earth at some distance inland, sea-shells, and even pieces of boat-timber, are discovered. The interior or upland districts, on the contrary, are very productive, and there the pepper is cultivated,
cultivated, which the king's agent (for trade in these parts is usually monopolized by the sovereign power) purchases at a cheap rate. In return he supplies the country people with opium, salt, and piece-goods, forming the cargoes of large boats (some of them sixty-six feet in length, and seven in breadth, from a single tree) which are towed against the stream. The goods intended for Passummah are conveyed to a place called Muara Mulang, which is performed in fourteen days, and from thence, by land, to the borders of that country, is only one day's journey. This being situated beyond the district where the pepper flourishes, their returns are chiefly made in pulas twine, raw silk in its roughest state, and elephants' teeth. From Musi they send likewise sulphur, alum, arsenic, and tobacco. Dragons'-blood and gambir are also the produce of the country.

These interior parts are divided into provinces, each of which is assigned as a fief or government to one of the royal family or of the nobles, who commit the management to deputies, and give themselves little concern about the treatment of their subjects. The panigerans, who are the descendants of the ancient princes of the country, experience much oppression, and when compelled to make their appearance at court, are denied every mark of ceremonious distinction. The present rulers of the kingdom of Palembang, and a great portion of the inhabitants of the city, originally came from the island of Java, in consequence, as some suppose, of an early conquest by the sovereigns of Majapahit; or, according to others, by those of Bantam, in more modern times; and in proof of its subjection, either real or nominal, to the latter, we find in the account of the first Dutch voyages, that "in 1596 a king of Bantam fell before Palembang, a rebel town of Sumatra, which he was besieging."

The Dutch claim the honour of having placed on the throne the family of the reigning sultan (1780), named Ratu Akhmet Bahar ed-din, whose eldest son bears the title of Panigeran Ratu, answering to the Raja muda of the Malays. The power of the monarch is unlimited by any legal restriction; but not keeping a regular body of troops in pay, his orders are often disregarded by the nobles. Although without any established revenue from taxes or contributions, the profit arising from the trade of pepper and tin (especially the latter) is so great, and the consequent
sequent influx of silver, without any apparent outlet, so considerable, that he must necessarily be possessed of treasure to a large amount. The customs on merchandize imported remain in the hands of the shabhandaras, who are required to furnish the king’s household with provisions and other necessaries. The domestic attendants on the prince are for the most part females.

The currency of the country and the only money allowed to be received at the king’s treasury is Spanish dollars; but there is also in general circulation a species of small base coin, issued by royal authority, and named pitis. These are cut out of plates composed of lead and tin, and having a square hole in the middle (like the Chinese cash), are strung in parcels of five hundred each, sixteen of which (according to the Batav. Trans.) are equivalent to the dollar. In weighing gold the tāil is considered as the tenth part of the katti (of a pound and a third), or equal to the weight of two Spanish dollars and a quarter.

The city is situated in a flat marshy tract, a few miles above the delta city of the river, about sixty miles from the sea, and yet so far from the mountains of the interior that they are not visible. It extends about eight miles along both banks, and is mostly confined to them and to the creeks which open into the river. The buildings, with the exception of the king’s palace and mosque, being all of wood or bamboos, standing on posts, and mostly covered with thatch of palm-leaves, the appearance of the place has nothing to recommend it. There are also a great number of floating habitations, mostly shops, upon bamboo-rafts moored to piles, and when the owners of these are no longer pleased with their situation, they remove upwards or downwards, with the tide, to one more convenient. Indeed, as the nature of the surrounding country, being overflowed in high tides, scarcely admits of roads, almost all communication is carried on by means of boats, which accordingly are seen moving by hundreds in every direction, without intermission. The dālam or palace being surrounded by a high wall, nothing is known to Europeans of the interior, but it appears to be large, lofty, and much ornamented on the outside. Immediately adjoining to this wall, on the lower side, is a strong, square, roofed battery, commanding the river.
and below it another; on both of which many heavy cannon are mounted, and fired on particular occasions. In the interval between the two batteries is seen the meidan or plain, at the extremity of which appears the balarong or hall where the sultan gives audience in public. This is an ordinary building, and serving occasionally for a warehouse, but ornamented with weapons arranged along the walls. The royal mosque stands behind the palace, and from the style of architecture seems to have been constructed by an European. It is an oblong building, with glazed windows, pilasters, and a cupola. The burial-place of these sovereigns is at old Palembang, about a league lower down the river, where the ground appears to be somewhat raised, from having long been the site of habitations.

The policy of these princes, who were themselves strangers, having always been to encourage foreign settlers, the city and lower parts of the river are in a great measure peopled with natives of China, Cochin-china, Camboja, Siam, Patani on the coast of the peninsula, Java, Celebes, and other eastern places. In addition to these, the Arabian priests are described by the Dutch as constituting a very numerous and pernicious tribe, who, although in the constant practice of imposing upon and plundering the credulous inhabitants, are held by them in the utmost reverence. The Mahometan religion prevails throughout all the dominions of the sultan, with the exception of a district near the sea-coast, called Salang, where the natives, termed orang kubu, live in the woods like wild animals. The literature of the country is said to be confined to the study of the koran, but opinions of this kind I have found in other instances to be too hastily formed, or by persons not competent to obtain the necessary information. The language of the king and his court is the high dialect of the Javan, mixed with some foreign idioms. In the general intercourse with strangers the conversation is always in Malayan, with the pronunciation (already noticed) of the final o for a. Amongst the people of Palembang themselves this language (the character of which they employ) is mixed with the common Javan. The Dutch, on whom we must rely for an account of the manners and disposition of these people, and which will be found in Vol. III. p. 122. of the Batav. Trans. describe those of the low country as devoid of every good
good quality, and imbued with every bad one; whilst those of the interior are spoken of as a dull, simple people, who shew much forbearance under oppression;* but it is acknowledged that of these last they have little knowledge, owing to the extreme suspicion and jealousy of the government, which takes alarm at any attempt to penetrate into the country.

This inland district having been visited only by two servants of the English East India Company who have left any record of their journeys, I shall extract from their narratives such parts as serve to throw a light upon its geography. The first of these was Mr. Charles Miller, who, on the 19th of September, 1770, proceeded from Fort Marlborough to Bentiring on the Bencoolen river, thence to Pagar-raddin, Kadras, Gunong Raja, Gunong Ayu, Kalindang, and Jambu, where he ascended the hills forming the boundary of the Company's district, which he found covered with lofty trees. The first dusun on the other side is named Kalubar, and situated on the banks of the river Musi. From thence his route lay to places called Kapiyong and Parahmu, from all of which the natives carry the produce of their country to Palembang by water. The setting in of the rains and difficulties raised by the guides prevented him from proceeding to the country where the Cassia is cut, and occasioned his return towards the hills, on the 10th of October, stopping at Tabat Bubut. The land in the neighbourhood of the Musi, he describes as being level, the soil black and good, and the air temperate. It was his intention to have crossed the hills to Ranne-lebar, on the 11th, but missing the road in the woods, reached next day, Beyol Bagus, a dusun in the Company's district, and thence proceeded to Gunong Raja, his way lying partly down a branch of the Bencoolen river, called Ayer Bagus, whose bed is formed of large pebble-stones, and partly through a level country,

* A ridiculous story is told of a custom amongst the inhabitants of a province named Blida, which I should not repeat but for its whimsical coincidence with a jeu d'esprit of our celebrated Swift. When a child is born there (say the Palembangers), and the father has any doubts about the honesty of his wife, he puts it to the proof by tossing the infant into the air, and catching it on the point of a spear. If no wound is thereby inflicted, he is satisfied of its legitimacy, but if otherwise, he considers it as spurious.
country, entirely covered with lofty bamboos. From Gunong Raja he returned down Bencoolen river, on a bamboo-raft, to Bentiring, and reached Fort Marlborough on the 18th of October. The other traveller, Mr. Charles Campbell, in a private letter, dated March, 1802, (referring me, for more detailed information, to journals which have not reached my hand) says,—"We crossed the hills nearly behind the Sugar-loaf, and entered the valley of Musi. Words cannot do justice to the picturesque scenery of that romantic and delightful country, locked in on all sides by lofty mountains, and watered by the noble river here navigable for very large canoes, which, after receiving the Lamatang and several other streams, forms the Palembang. Directing our course behind the great hill of Sungei-lamo, we in three days discovered Labun, and crossed some considerable streams discharging themselves into the river of Kattaun. Our object there being completed, we returned along the banks of the Musi nearly to the dusun of Kalubat, at which place we struck into the woods, and, ascending the mountain, reached towards evening a village high up on the Bencoolen river. There is but a single range, and it is a fact, that from the navigable part of the Musi river to a place on that of Bencoolen where rafts and sampans may be used, is to the natives a walk of no more than eight hours. Musi is populous, well cultivated, and the soil exceedingly rich. The people are stout, healthy-looking, and independent in their carriage and manners, and were to us courteous and hospitable. They acknowledge no superior authority, but are often insulted by predatory parties from Palembang." These freebooters would perhaps call themselves collectors of tribute. It is much to be regretted, that little political jealousies and animosities between the European powers whose influence prevails on each side of the island, prevent further discoveries of the course of this considerable river.
The Country of the Battas—Tappanuli-bay—Journey into the Interior—
Cassia-trees—Governments—Arms—Warfare—Trade—Fairs—Food—
Manners—Language—Writing—Religion—Funerals—Crimes—Extra-
ordinary Custom.

One of the most considerable distinctions of people in the island, and
by many regarded as having the strongest claims to originality, is the
nation of the Battas (properly Batak), whose remarkable dissimilitude
to the other inhabitants, in the genius of their customs and manners,
and especially in some extraordinary usages, renders it necessary that a
particular degree of attention should be paid to their description.

This country is bounded on the north by that of Achin, from which it
is separated by the mountains of Papa and Deira, and on the south by
the independent district of Rau or Rawo; extending along the sea-coast
on the western side, from the river of Sinókel to that of Tabuyong, but
inland, to the back of Ayer Baŋgis, and generally across the island,
which is narrow in that part, to the eastern coast; but more or less en-
croached upon by the Malayan and Chinese establishments in the most
convenient maritime situations, for the purposes of their commerce. It
is very populous, and chiefly in the central parts, where are extensive,
open or naked plains, on the borders (as it is said) of a great lake; the
soil fertile, and cultivation so much more prevalent than in the southern
countries, which are mostly covered with woods, that there is scarcely a
tree to be seen excepting those planted by the natives about their villages,
which are not, as elsewhere, on the banks of rivers, but wherever a strong
situation presents itself. Water, indeed, is not so abundant as to the
southward, which may be attributed to the comparatively level surface, the
chain of high mountains which extends northwards from the straits of
Sunda through the interior of the island, in a great measure terminating
with gunong Passummah or Mount Ophir. About the bay of Tappanuli,
however, the land is high and wooded near the coast.

The
Its divisions. The Batta territory is divided (according to the information obtained by the English Residents) into the following principal districts; Ankola, Padambola, Mandiling, Toba, Selindong, and Singkel, of which the first has five, the third three, and the fourth five subordinate tribes. According to the Dutch account published in the Transactions of the Batav. Society, which is very circumstantial, it is divided into three small kingdoms. One of these named Simamora is situated far inland, and contains a number of villages, and among others those named Batong, Ria, Alias, Batadera, Kapkap (where the district producing benzoin commences), Batalol, Kotta-tinaggi (the place of the king’s residence), with two places lying on the eastern coast called Suitara-male and Jambu-ayer. This kingdom is said to yield much fine gold, from the mines of Batong and Sunayang. Bata-salindong also contains many districts, in some of which benzoin, and in others fine gold, is collected. The residence of the king is at Salindong. Bata-gopit lies at the foot of a volcano-mountain of that name, from whence, at the time of an eruption, the natives procure sulphur, to be afterwards employed in the manufacture of gunpowder. The little kingdom of Butar lies northeastward of the preceding, and reaches to the eastern coast, where are the places named Pulo Seromy and Batu Bara; the latter enjoying a considerable trade; also Longtong and Sirigar, at the mouth of a great river named Assahan. Butar yields neither camphor, benzoin, nor gold, and the inhabitants support themselves by cultivation. The residence of the king is at a town of the same name. High up on the river of Batu Bara, which empties itself into the straits of Malacca, is found a large brick building, concerning the erection of which no tradition is preserved amongst the people. It is described as a square, or several squares, and at one corner is an extremely high pillar, supposed by them to have been designed for carrying a flag. Images, or reliefs, of human figures are carved in the walls, which they conceive to be Chinese (perhaps Hindu) idols. The bricks, of which some were brought to Tappanuli, are of a smaller size than those used by the English.

Singkel. Singkel river, by much the largest on the western coast of the island, has its rise in the distant mountains of Daholi, in the territory of Achin, and at the distance of about thirty miles from the sea, receives the waters
of the Sikere, at a place called Pomoko, running through a great extent of the Batta country. After this junction it is very broad, and deep enough for vessels of considerable burden, but the bar is shallow and dangerous, having no more than six feet at low water spring-tides, and the rise is also six feet. The breadth here is about three quarters of a mile. Much of the lower parts of the country through which it has its course is overflowed during the rainy season, but not at two places, called by Capt. Forrest Rambong and Jambong, near the mouth. The principal town lies forty miles up the river, on the northern branch. On the southern is a town named Kiking, where more trade is carried on by the Malays and Achinese, than at the former, the Samponan or Papa mountains producing more benzoin than those of Daholi. It is said in a Dutch manuscript, that in three days’ navigation above the town of Siṅkel you come to a great lake, the extent of which is not known.

Barus, the next place of any consequence to the southward, is chiefly remarkable for having given name throughout the East to the Kapur-barus or native camphor, as it is often termed, to distinguish it from that which is imported from Japan and China, as already explained. This was the situation of the most remote of the Dutch factories, long since withdrawn. It is properly a Malayan establishment, governed by a raja, a bandhara, and eight paṅgulus, and with this peculiarity, that the rajas and bandharas must be alternately and reciprocally of two great families, named Dulu and D'ilhir. The assumed jurisdiction is said to have extended formerly to Natal. The town is situated about a league from the coast, and two leagues farther inland are eight small villages inhabited by Battas, the inhabitants of which purchase the camphor and benzoin from the people of the Diri mountains, extending from the southward of Siṅkel to the hill of Lasa, behind Barus, where the Tōbat district commences.

The celebrated bay of Tappanuli stretches into the heart of the Batta country, and its shores are every-where inhabited by that people, who barter the produce of their land for the articles they stand in need of from abroad, but do not themselves make voyages by sea. Navigators assert, that the natural advantages of this bay are scarcely surpassed in any other
other part of the globe; that all the navies of the world might ride there with perfect security in every weather; and that such is the complication of anchoring-places within each other, that a large ship could be so hid in them, as not to be found without a tedious search. At the island of Punchong kechil, on which our settlement stands, it is a common practice to moor the vessels by a hawser to a tree on shore. Timber for masts and yards is to be procured in the various creeks with great facility. Not being favourably situated with respect to the general track of outward and homeward-bound shipping, and its distance from the principal seat of our important Indian concerns being considerable, it has not hitherto been much used for any great naval purposes; but at the same time our government should be aware of the danger that might arise from suffering any other maritime power to get footing in a place of this description. The natives are in general inoffensive, and have given little disturbance to our establishments; but parties of Achinese traders (without the concurrence or knowledge, as there is reason to believe, of their own government), jealous of our commercial influence, long strove to drive us from the bay, by force of arms, and we were under the necessity of carrying on a petty warfare for many years, in order to secure our tranquillity. In the year 1760 Tappanuli was taken by a squadron of French ships under the command of the Comte d'Estaing; and in October, 1809, being nearly defenceless, it was again taken by the Créole French frigate, Capt. Ripaud, joined afterwards by the Venus and La Manche, under the orders of Commodore Hamelin. By the terms of the surrender private property was to be secured, but in a few days, after the most friendly assurances had been given to the acting resident, with whom the French officers were living, this engagement was violated, under the ill-founded pretence that some gold had been secreted, and every thing belonging to the English gentlemen and ladies, as well as to the native settlers, was plundered or destroyed by fire, with circumstances of atrocity and brutality that would have disgraced savages. The garden-house of the chief (Mr. Prince, who happened to be then absent from Tappanuli) at Batu-buru on the main was likewise burned, together with his horses, and his cattle were shot at and maimed. Even the books of accounts, containing the statement of outstanding debts due to the trading-concern of the place were, in spite of every entreaty, maliciously
maliciously destroyed or carried off, by which an irreparable loss, from which the enemy could not derive a benefit, is sustained by the unfortunate sufferers. It cannot be supposed that the government of a great and proud empire can give its sanction to this disgraceful mode of carrying on war.

In the Phil. Transact. for the year 1778, is a brief account of the Batta country and the manners of its inhabitants, extracted from the private letters of Mr. Charles Miller, the Company's botanist, whose observations I have had repeated occasion to quote. I shall now communicate to the reader the substance of a report made by him of a journey performed in company with Mr. Giles Holloway, then resident of Tappanuli, through the interior of the country of which we are now speaking, with a view to explore its productions, particularly the Cassia, which at that time was thought likely to prove an object of commerce worthy of attention.

"Previously," says Mr. Miller, "to our setting out on this journey, we consulted people who had formerly been engaged in the cassia-trade, with regard to the most proper places to visit. They informed us that the trees were to be found in two different districts; viz. in the inland parts to the northward of the old settlement at Tappanuli; and also in the country of Padambola, which lies between fifty and sixty miles more to the southward. They advised us to prefer going into the Padambola country, although the more distant, on account of the inhabitants of the Tappanuli country (as they represented) being frequently troublesome to strangers. They also told me there were two kinds of the kulit manis, the one of which, from their account of it, I was in hopes might prove to be the true cinnamon-tree.

"June 21st, 1772. We set out from Pulo Punchong, and went in boats to the quallo (mouth or entrance) of Pinang Suri river, which is in the bay, about ten or twelve miles south-east of Punchong. Next morning we went up the river in sampans, and in about six hours arrived at a place called quallo Lumut. The whole of the land on both sides of the river is low, covered with wood, and uninhabited. In these woods
woods I observed camphor trees, two species of oak, maranti, raiigi, and several other timber-trees. About a quarter of a mile from that place, on the opposite side of the river, is a Batta kampong, situated on the summit of a regular and very beautiful little hill, which rises in a pyramidal form, in the middle of a small meadow. The raja of this kampong being informed by the Malays that we were at their houses, came over to see us, and invited us to his house, where we were received with great ceremony, and saluted with about thirty guns. This kampong consists of about eight or ten houses, with their respective padi-houses. It is strongly fortified with a double fence of strong, rough camphor planks, driven deep into the earth, and about eight or nine feet high, so placed, that their points project considerably outward. These fences are about twelve feet asunder, and in the space between them the buffaloes are kept at night. Without-side these fences they plant a row of a prickly kind of bamboo, which forms an almost impenetrable hedge, from twelve to twenty feet thick. In the sapijau or building in which the raja receives strangers, we saw a man’s skull hanging up, which he told us was hung there as a trophy, it being the skull of an enemy they had taken prisoner, whose body (according to the custom of the Battas) they had eaten about two months before. June 23d. We walked through a level woody country to the kampong of Lumut, and next day to Satarong, where I observed several plantations of benzoin trees, some cotton, indigo, turmeric, tobacco, and a few pepper-vines. We next proceeded to Tappolen, to Sikia, and to Sa-pisang. This last is situated on the banks of Batang-tara river, three or four days’ journey from the sea; so that our course had hitherto been nearly parallel to the coast.

"July 1st. We left Sa-pisang and took a direction towards the hills, following nearly the course of the Batang-tara. We travelled all this day through a low, woody, and entirely uncultivated country, which afforded nothing worthy of observation. Our guide had proposed to reach a kampong, called Lumbu, but missing the road, we were obliged to wade up the river between four and five miles, and at length arrived at a ladang extremely fatigued; where the badness of the weather obliged us to stop, and take up our quarters in an open padi-shed. The next
next day the river was so swelled by the heavy rain which had fallen the preceding day, that we could not prosecute our journey, and were obliged to pass it and the remaining night in the same uncomfortable situation. (This is the middle of the dry season in the southern parts of the island.) July 3d. We left the ladang, and walked through a very irregular and uninhabited tract, full of rocks and covered with woods. We this day crossed a ridge of very steep and high hills, and in the afternoon came to an inhabited and well cultivated country, on the edge of the plains of Ancola. We slept this night in a small open shed, and next day proceeded to a kampong, called Koto Lambong. July 5th. Went through a more open and very pleasant country to Terimbaru, a large kampong on the southern edge of the plains of Ancola. The land hereabout is entirely clear of wood, and either ploughed and sown with padi or jagong (maiz), or used as pasture for their numerous herds of buffaloes, kine, and horses. The raja being informed of our intentions to come there, sent his son, and between thirty and forty men, armed with lances and match-lock guns, to meet us, who escorted us to their kampong, beating gongs and firing their guns all the way. The raja received us in great form, and with civility ordered a buffalo to be killed, detained us a day, and when we proceeded on our journey, sent his son with a party to escort us. I observed that all the unmarried women wore a great number of tin rings in their ears (some having fifty in each ear;) which circumstance, together with the appearance of the country, seemed to indicate its abounding with minerals; but on making inquiry, I found that the tin was brought from the straits of Malacca. Having made the accustomed presents to the raja, we left Terimbaru, July 7th, and proceeded to Sa-masam, the raja of which place, attended by sixty or seventy men, well armed, met us and conducted us to his kampong, where he had prepared a house for our reception, treating us with much hospitality and respect. The country round Sa-masam is full of small hills, but clear of wood, and mostly pasture ground for their cattle, of which they have great abundance. I met with nothing remarkable here excepting a prickly shrub, called by the natives Andalimon, the seed-vessels and leaves of which have a very agreeable spicy taste, and are used by them in their curries.

3 B 2

"July
SAMATRA.

"July 10th. Proceeded on our journey to Batang Onan, the kampong where the Malays used to purchase the cassia from the Battas. After about three hours walk over an open hilly country, we again came into thick woods, in which we were obliged to pass the night. The next morning we crossed another ridge of very high hills, covered entirely with woods. In these we saw the wild benzoin-tree. It grows to a much larger size than the cultivated kind, and yields a different sort of resin, called kaminian dulong or sweet-scented benzoin. It differs in being commonly in more detached pieces, and having a smell resembling that of almonds when bruised. Arrived at Batang Onan in the afternoon. This kampong is situated in a very extensive plain, on the banks of a large river which empties itself into the straits of Malacca, and is said to be navigable for sloops to within a day’s journey of Batang Onan. July 11th. Went to Panka-dulut, the raja of which place claims the property of the cassia-trees, and his people used to cut and cure the bark, and transport it to the former place. The nearest trees are about two hours walk from Panka-dulut, on a high ridge of mountains. They grow from forty to sixty feet high, and have large spreading heads. They are not cultivated, but grow in the woods. The bark is commonly taken from the bodies of the trees of a foot or foot and half diameter; the bark being so thin, when the trees are younger, as to lose all its qualities very soon. I here inquired for the different sorts of cassia-tree of which I had been told, but was now informed that there was only one sort, and that the difference they mentioned was occasioned entirely by the soil and situation in which the trees grow; that those which grow in a rocky, dry soil, have red shoots, and their bark is of superior quality to that of trees which grow in moist clay, whose shoots are green. I also endeavoured to get some information with regard to their method of curing and quilling the cassia, and told them my intentions of trying some experiments towards improving its quality and rendering it more valuable. They told me that none had been cut for two years past, on account of a stop being put to the purchases at Tappanuli; and that if I was come with authority to open the trade, I should call together the people of the neighbouring kampons, kill a buffalo for them, and assure them publicly that the cassia would be again received; in which case they
SUMATRA.

they would immediately begin to cut and cure it, and would willingly follow any instructions I should give them; but that otherwise they would take no trouble about it. I must observe, that I was prevented from getting so satisfactory an account of the cassia as I could have wished, by the ill-behaviour of the person who accompanied us as guide, from whom, by his thorough knowledge of the country, and of the cassia-trade, of which he had formerly been the chief manager, we thought we had reason to expect all requisite assistance and information, but who not only refused to give it, but prevented as much as possible our receiving any from the country people. July 14th. We left Batang Onan in order to return, stopped that night at a kampong called Koto Moran, and the next evening reached Sa-masam; from whence we proceeded, by a different road from what we had travelled before, to Sapisang, where we procured sampans, and went down the Batang-tara river to the sea. July 22d we returned to Pulo Punchong."

It has since been understood that they were intentionally misled, and taken by a circuitous route, to prevent their seeing a particular kampong of some consideration, at the back of Tappanuli, or for some other interested object. Near the latter place, on the main, Mr. John Marsden, who went thither to be present at the funeral of one of their chiefs, observed two old monuments in stone, one the figure of a man, the other of a man on an elephant; tolerably well executed, but they know not by whom, nor is there any among them who could do the same work now. The features were strongly Battá.

Our settlement at Natal (properly Natar), some miles to the south of Natal, the large river of Tabuyong, and on the confines of the Battá country, which extends at the back of it, is a place of much commerce, but not from its natural or political circumstances of importance in other respects. It is inhabited by settlers there, for the convenience of trade, from the countries of Achin, Rau, and Menaṅgkabau, who render it populous and rich. Gold, of very fine quality, is procured from the country (some of the mines being said to lie within ten miles of the factory), and there is a considerable vent for imported goods, the returns for which are chiefly made in that article and camphor. Like other Malayan
Malayan towns it is governed by datus, the chief of whom, styled datu besár or chief magistrate, has considerable sway; and although the influence of the Company is here predominant, its authority is by no means so firmly established as in the pepper-districts to the southward; owing to the number of people, their wealth, and enterprising, independent spirit. It may be said, that they are rather managed and conciliated than ruled. They find the English useful as moderators between their own contending factions, which often have recourse to arms, even upon points of ceremonious precedence, and are reasoned into accommodation by our resident going among them unattended. At an earlier period our protection was convenient to them against the usurpation, as they termed it, of the Dutch, of whose attempts and claims they were particularly jealous. By an article of the treaty of Paris, in 1763, these pretensions were ascertained as they respected the two European powers, and the settlements of Natal and Tapanuli were expressly restored to the English. They had, however, already been re-occupied. Neither, in fact, have any right but what proceeds from the will and consent of the native princes.

The government of the Battá country, although nominally in the hands of three or more sovereign rajas, is effectively (so far as our intercourse with the people enables us to ascertain) divided into numberless petty chiefships, the heads of which, also styled rajas, have no appearance

* Upon the re-establishment of the factory in 1762, the resident pointed out to the Datu besár, with a degree of indignation, the number of dead bodies which were frequently seen floating down the river, and proposed his co-operating to prevent assassinations in the country; occasioned by the anarchy the place fell into, during the temporary interruption of the Company’s influence. “I cannot assent to any measures for that purpose,” replied the datu: “I reap from these murders an advantage of twenty dollars a head, when the families prosecute.” A compensation of thirty dollars per month was offered him, and to this he scarcely submitted, observing that he should be a considerable loser, as there fell in this manner at least three men in the month. At another time, when the resident attempted to carry some regulation into execution, he said, “kami tradah suka begito, orang kaya!” “We do not chuse to allow it, sir;” and bared his right arm, as a signal of attack to his dependants, in case the point had been insisted on. Of late years, habit and a sense of mutual interest have rendered them more accommodating.
ance of being dependant upon any superior power, but enter into associations with each other, particularly with those belonging to the same tribe, for mutual defence and security against any distant enemy. They are at the same time extremely jealous of any increase of their relative power, and on the slightest pretext a war breaks out between them. The force of different kampongs is, notwithstanding this, very unequal, and some rajas possess a much more extensive sway than others; and it must needs be so, where every man who can get a dozen followers, and two or three muskets, sets up for independence. Inland of a place called Sokum, great respect was paid to a female chief or uti (which word I conceive to be a liquid pronunciation of putri, a princess), whose jurisdiction comprehended many tribes. Her grandson, who was the reigning prince, had lately been murdered by an invader, and she had assembled an army of two or three thousand men, to take revenge. An agent of the Company went up the river about fifteen miles, in hopes of being able to accommodate a matter that threatened materially the peace of the country; but he was told by the uti, that unless he would land his men, and take a decided part in her favour, he had no business there, and he was obliged to reimbark without effecting any thing. The aggressor followed him the same night, and made his escape. It does not appear likely, from the manners and dispositions of the people, that the whole of the country was ever united under one supreme head.

The more powerful rajas assume authority over the lives of their subjects. The dependants are bound to attend their chief in his journeys and in his wars, and when an individual refuses, he is expelled from the society, without permission to take his property along with him. They are supplied with food for their expeditions, and allowed a reward for each person they kill. The revenues of the chief arise principally from fines of cattle adjudged in criminal proceedings, which he always appropriates to himself; and from the produce of the camphor and benzoin trees throughout his district; but this is not rigorously insisted upon. When he pays his gaming debts, he imposes what arbitrary value he thinks proper on the horses and buffaloes (no coin being used in
in the country), which he delivers, and his subjects are obliged to accept them at that rate. They are forced to work in their turns, for a certain number of days, in his rice plantations. There is, in like manner, a lesser kind of service for land held of any other person; the tenant being bound to pay his landlord respect wherever he meets him, and to provide him with entertainment whenever he comes to his house. The people seem to have a permanent property in their possessions, selling them to each other as they think fit. If a man plants trees, and leaves them, no future occupier can sell them, though he may eat the fruit. Disputes and litigations of any kind that happen between people belonging to the same kampong are settled by a magistrate appointed for that purpose, and from him, it is said, there is no appeal to the raja: when they arise between persons of different kampons, they are adjusted at a meeting of the respective rajas. When a party is sent down to the Bay, to purchase salt, or on other business, it is accompanied by an officer, who takes cognizance of their behaviour, and sometimes punishes on the spot such as are criminal or refractory. This is productive of much order and decency.

**Succession.**

It is asserted, that the succession to the chiefships does not go, in the first instance, to the son of the deceased, but to the nephew by a sister; and that the same extraordinary rule, with respect to property in general, prevails also amongst the Malays of that part of the island, and even in the neighbourhood of Padang. The authorities for this are various and unconnected with each other, but not sufficiently circumstantial to induce me to admit it as a generally established practice.

Notwithstanding the independent spirit of the Battas, and their contempt of all power that would affect a superiority over their little societies, they have a superstitious veneration for the sultan of Menangkabau, and shew blind submission to his relations and emissaries, real or pretended, when such appear among them for the purpose of levying contributions: even when insulted and put in fear of their lives, they make no attempt at resistance: they think that their affairs would never prosper;
prosper; that their *padi* would be blighted, and their buffaloes die; that they would remain under a kind of spell, for offending those sacred messengers.

The *Battas* are in their persons rather below the stature of the Malays, and their complexions are fairer; which may, perhaps, be owing to their distance, for the most part, from the sea, an element they do not at all frequent. Their dress is commonly of a sort of cotton cloth manufactured by themselves, thick, harsh, and wiry, about four *astas* or cubits long, and two in breadth, worn round the middle, with a scarf over the shoulder. These are of mixed colours, the prevalent being a brownish red, and a blue approaching to black. They are fond of adorning them, particularly the scarf, with strings and tassels of beads. The covering of the head is usually the bark of a tree, but the superior class wear a strip of foreign blue cloth, in imitation of the Malayan *destars*, and a few have *bajus* (outer garments) of chintz. The young women, beside the cloth round the middle, have one over the breasts, and (as noticed in Mr. Miller's journal) wear in their ears numerous rings of tin, as well as several large rings of thick brass wire round their necks. On festival days, however, they ornament themselves with ear-rings of gold, hair-pins, of which the heads are fashioned like birds or dragons, a kind of three-cornered breast-plate, and hollow rings upon the upper arm, all, in like manner, of gold. The *kima* shell, which abounds in the bay, is likewise worked into arm-rings, whiter, and taking a better polish than ivory.

Their arms are match-lock guns, with which they are expert marksmen, bamboo lances or spears with long iron heads, and a side-weapon called *jono*, which resembles and is worn as a sword rather than a *kris*. The cartridge-boxes are provided with a number of little wooden cases, each containing a charge for the piece. In these are carried likewise the match, and the smaller *ranjau*, the longer being in a joint of bamboo, slung like a quiver over the shoulder. They have machines curiously carved and formed like the beak of a large bird, for holding bullets, and others of peculiar construction, for a reserve of powder. These hang in front. On the right side hang the flint and steel, and
also the tobacco-pipe. Their guns, the locks of which (for holding the match) are of copper, they are supplied with by traders from Menaigkabau; the swords are of their own workmanship, and they also manufacture their own gunpowder, extracting the saltpetre, as it is said, from the soil taken from under houses that have been long inhabited, (which, in consequence of an uncleanly practice, is strongly impregnated with animal salts), together with that collected in places where goats are kept. Through this earth water is filtered, and being afterwards suffered to evaporate, the saltpetre is found at the bottom of the vessel. Their proper standard in war is a horse’s head, from whence flows a long mane or tail; beside which they have colours of red or white cloth. For drums they use gongs, and in action set up a kind of war-hoop.

The spirit of war is excited among these people by small provocation, and their resolutions for carrying it into effect are soon taken. Their life appears, in fact, to be a perpetual state of hostility, and they are always prepared for attack and defence. When they proceed to put their designs into execution, the first act of defiance is firing, without ball, into the kampong of their enemies. Three days are then allowed for the party fired upon to propose terms of accommodation, and if this is not done, or the terms are such as cannot be agreed to, war is then fully declared. This ceremony of firing with powder only, is styled, “carrying smoke to the adversary.” During the course of their wars, which sometimes last for two or three years, they seldom meet openly in the field, or attempt to decide their contest by a general engagement; as the mutual loss of a dozen men might go near to ruin both parties, nor do they ever engage hand to hand, but keep at a pretty safe distance, seldom nearer than random-shot, excepting in case of sudden surprise. They march in single files, and usually fire kneeling. It is not often that they venture a direct attack upon each others works, but watch opportunities of picking off stragglers passing through the woods. A party of three or four will conceal themselves near the footways, and if they see any of their foes, they fire and run away immediately; planting ranjaus after them, to prevent pursuit. On these occasions a man will subsist upon a potatoe a day, in which they have much
much the advantage of the Malays, (against whom they are often engaged in warfare) who require to be better fed.

They fortify their kampongs with large ramparts of earth, half way up which they plant brush-wood. There is a ditch without the rampart, and on each side of that a tall palisade of camphor timber. Beyond this is an impenetrable hedge of prickly bamboo, which, when of sufficient growth, acquires an extraordinary density, and perfectly conceals all appearance of a town. Ranjans, of a length both for the body and the feet, are disposed without all these, and render the approaches hazardous to assailants who are almost naked. At each corner of the fortress, instead of a tower or watch-house, they contrive to have a tall tree, which they ascend to reconnoitre or fire from. But they are not fond of remaining on the defensive in these fortified villages, and therefore, leaving a few to guard them, usually advance into the plains, and throw up temporary breastworks and entrenchments.

The natives of the sea-coast exchange their benzoin, camphor, and cassia (the quantity of gold-dust is very inconsiderable) for iron, steel, brass-wire, and salt, of which last article an hundred thousand bamboo measures are annually taken off in the bay of Tappanuli. These they barter again with the more inland inhabitants, in the mode that shall presently be described, for the products and manufactures of the country, particularly the home-made cloth; a very small quantity of cotton piece-goods being imported from the coast, and disposed of to the natives. What they do take off is chiefly blue-cloth for the head, and chintz.

For the convenience of carrying on the inland-trade, there are established at the back of Tappanuli, which is their great mart, four stages, at which successively they hold public fairs or markets on every fourth day throughout the year; each fair, of course, lasting one day. The people in the district of the fourth stage assemble with their goods at the appointed place, to which those of the third resort in order to purchase them. The people of the third, in like manner, supply the wants of the second, and the second of the first, who dispose, on the day the
market is held, of the merchandise for which they have trafficked with the Europeans and Malays. On these occasions all hostilities are suspended. Each man who possesses a musket carries it with a green bough in the muzzle, as a token of peace, and afterwards, when he comes to the spot, following the example of the director or manager of the party, discharges the loading into a mound of earth; in which, before his departure, he searches for his ball. There is but one house at the place where the market is held, and that is for the purpose of gaming. The want of booths is supplied by the shade of regular rows of fruit-trees, mostly durian, of which one avenue is reserved for the women. The dealings are conducted with order and fairness; the chief remaining at a little distance, to be referred to in case of dispute, and a guard is at hand, armed with lances, to keep the peace; yet with all this police, which bespeaks civilization, I have been assured by those who have had an opportunity of attending their meetings, that in the whole of their appearance and deportment there is more of savage life than is observed in the manners of the Rejangs, or inhabitants of Lampang. Traders from the remoter Battia districts, lying north and south, assemble at these periodical markets, where all their traffic is carried on, and commodities bartered. They are not, however, peculiar to this country, being held, among other places, at Batang-kapas and Ipu. By the Malays they are termed onan.

Having no coin, all value is estimated among them by certain commodities. In trade, they calculate by tampangs (cakes) of benzoin; in transactions among themselves, more commonly by buffaloes: sometimes brass wire, and sometimes beads, are used as a medium. A galang, or ring of brass wire, represents about the value of a dollar. But for small payments, salt is the most in use. A measure called a salup, weighing about two pounds, is equal to a fanam or twopence-halfpenny: a balli, another small measure, goes for four keppeng, or three-fifths of a penny.

The ordinary food of the lower class of people is maiz and sweet potatoes; the rajas and great men alone indulging themselves with rice. Some mix them together. It is only on public occasions that they kill cattle
cattle for food; but not being delicate in their appetites, they do not scruple to eat part of a dead buffalo, hog, rat, alligator, or any wild animal with which they happen to meet. Their rivers are said not to abound with fish. Horse-flesh they esteem their most exquisite meat, and for this purpose feed them upon grain, and pay great attention to their keep. They are numerous in the country, and the Europeans at Bencoolen are supplied with many good ones from thence, but not with the finest, as these are reserved for their festivals. They have also, says Mr. Miller, great quantities of small black dogs, with erect pointed ears, which they fatten and eat. Toddy or palm-wine they drink copiously at their feasts.

The houses are built with frames of wood, with the sides of boards, and roof covered with tju. They usually consist of a single large room, which is entered by a trap-door in the middle. The number seldom exceeds twenty in one kampong; but opposite to each is a kind of open building, that serves for sitting in during the day, and as a sleeping-place for the unmarried men at night. These together form a sort of street. To each kampong there is also a balei, where the inhabitants assemble for transacting public business, celebrating feasts, and the reception of strangers, whom they entertain with frankness and hospitality. At the end of this building is a place divided off, from whence the women see the spectacles of fencing and dancing; and below that is a kind of orchestra for music.

The men are allowed to marry as many wives as they please, or can afford, and to have half a dozen is not uncommon. Each of these sits in a different part of the large room, and sleeps exposed to the others; not being separated by any partition or distinction of apartments. Yet the husband finds it necessary to allot to each of them their several fire-places, and cooking utensils, where they dress their own victuals separately, and prepare his in turns. How is this domestic state, and the flimsiness of such an imaginary barrier, to be reconciled with our ideas of the furious, ungovernable passions of love and jealousy, supposed to prevail in an eastern haram? or must custom be allowed to supersede all other influence, both moral and physical? In other respects
sumatra.

spects they differ little in their customs relating to marriage from the rest of the island. The parents of the girl always receive a valuable consideration (in buffaloes or horses) from the person to whom she is given in marriage; which is returned when a divorce takes place against the man's inclination. The daughters, as elsewhere, are looked upon as the riches of the fathers.

Condition of women. The condition of the women appears to be no other than that of slaves, the husbands having the power of selling their wives and children. They alone, beside the domestic duties, work in the rice plantations. These are prepared in the same mode as in the rest of the island; except that in the central parts, the country being clearer, the plough and harrow, drawn by buffaloes, are more used. The men, when not engaged in war, their favourite occupation, commonly lead an idle, inactive life, passing the day in playing on a kind of flute, crowned with garlands of flowers; among which the globe-amaranthus, a native of the country, mostly prevails. They are said, however, to hunt deer on horseback, and to be attached to the diversions of horse-racing. They ride boldly without a saddle or stirrups, frequently throwing their hands upwards whilst pushing their horse to full speed. The bit of the bridle is of iron, and has several joints; the head-stall and reins of rattan: in some parts the reins, or halter rather, is of iju, and the bit of wood. They are, like the rest of the Sumatrans, much addicted to gaming, and the practice is under no kind of restraint, until it destroys itself by the ruin of one of the parties. When a man loses more money than he is able to pay, he is confined and sold as a slave; being the most usual mode by which they become such. A generous winner will sometimes release his unfortunate adversary upon condition of his killing a horse, and making a public entertainment.

Horse-racing.

Language. They have, as was before observed, a language and written character peculiar to themselves, and which may be considered, in point of originality, as equal at least to any other in the island; and although, like the languages of Java, Celebes, and the Philippines, it has many terms in common with the Malayan (being all, in my judgment, from one common stock), yet, in the way of encroachment, from the influence, both
both political and religious, acquired by its immediate neighbours, the Battla tongue appears to have experienced less change than any other. For a specimen of its words, its alphabet, and the rules by which the sound of its letters is modified and governed, the reader is referred to the Table and Plate at p. 203. It is remarkable, that the proportion of the people who are able to read and write is much greater than of those who do not; a qualification seldom observed in such uncivilized parts of the world, and not always found in the more polished. Their writing, for common purposes, is, like that already described in speaking of the Rejangs, upon pieces of bamboo. Their books (and such they may with propriety be termed) are composed of the inner bark of a certain tree, cut into long slips, and folded in squares, leaving part of the wood at each extremity, to serve for the outer covering. The bark, for this purpose, is shaved smooth and thin, and afterwards rubbed over with rice-water. The pen they use is a twig or the fibre of a leaf, and their ink is made of the soot of dammar, mixed with the juice of the sugar-cane. The contents of their books are little known to us. The writing of most of those in my possession is mixed with uncouth representations of sclolopendra and other noxious animals, and frequent diagrams, which imply their being works of astrology and divination. These they are known to consult in all the transactions of life, and the event is predicted by the application of certain characters marked on a slip of bamboo, to the lines of the sacred book, with which a comparison is made. But this is not their only mode of divining. Before going to war they kill a buffalo or a fowl that is perfectly white, and by observing the motion of the intestines, judge of the good or ill fortune likely to attend them; and the priest who performs this ceremony had need to be infallible, for if he predicts contrary to the event, it is said that he is sometimes punished with death for his want of skill. Exclusively, however, of these books of necromancy, there are others containing legendary and mythological tales, of which latter a sample will be given under the article of religion.

Dr. Leyden, in his Dissertation on the Languages and Literature of the Indo-Chinese nations, says, that the Battla character is written nei-
ther from right to left, nor from left to right, nor from top to bottom, but in a manner directly opposite to that of the Chinese, from the bottom to the top of the line, and that I have conveyed an erroneous idea of their natural form, by arranging the characters horizontally, instead of placing them in a perpendicular line. Not having now the opportunity of verifying, by ocular proof, what I understood to be the practical order of their writing, namely, from left to right (in the manner of the Hindus, who, there is reason to believe, were the original instructors of all these people), I shall only observe, that I have among my papers three distinct specimens of the Batta alphabet, written by different natives, at different periods, and all of them are horizontal. But I am at the same time aware that as this was performed in the presence of Europeans, and upon our paper, they might have deviated from their ordinary practice, and that the evidence is therefore not conclusive. It might be presumed, indeed, that the books themselves would be sufficient criterion; but, according to the position in which they are held, they may be made to sanction either mode, although it is easy to determine by simple inspection, the commencement of the lines. In the Batav. Trans. (Vol. III. p. 23.) already so often quoted, it is expressly said, that these people write like Europeans from the left hand towards the right: and, in truth, it is not easy to conceive how persons making use of ink can conduct the hand from the bottom to the top of a page without marring their own performance. But still a matter of fact, if such it be, cannot give way to argument, and I have no object but to ascertain the truth.

Their religion, like that of all other inhabitants of the island who are not Mahometans, is so obscure in its principles, as scarcely to afford room to say that any exists among them. Yet they have rather more of ceremony and observance than those of Rejang or Passummah, and there is an order of persons by them called guru (a well-known Hindu term), who may be denominated priests, as they are employed in administering oaths, foretelling lucky and unlucky days, making sacrifices, and the performance of funeral rites. For a knowledge of their theogony we are indebted to M. Siberg, governor of the Dutch settlements on the coast
of Sumatra, by whom the following account was communicated to the late M. Radermacher, a distinguished member of the Batavian Society, and by him published in its Transactions.

"The inhabitants of this country have many fabulous stories, which shall be briefly mentioned. They acknowledge three deities as rulers of the world, who are respectively named Batara-guru, Sori-pada, and Mangalla-bulang. The first, say they, bears rule in heaven, is the father of all mankind, and partly, under the following circumstances, creator of the earth, which from the beginning of time had been supported on the head of Naga-padoha, but growing weary at length, he shook his head, which occasioned the earth to sink, and nothing remained in the world excepting water. They do not pretend to a knowledge of the creation of this original earth and water, but say that at the period when the latter covered every thing, the chief deity, Batara-guru, had a daughter named Puti-orla-bulan, who requested permission to descend to these lower regions, and accordingly came down on a white owl, accompanied by a dog; but not being able, by reason of the waters, to continue there, her father let fall from heaven a lofty mountain, named Bakarra, now situated in the Battra country, as a dwelling for his child; and from this mountain all other land gradually proceeded. The earth was once more supported on the three horns of Naga-padoha, and that he might never again suffer it to fall off, Batara-guru sent his son, named Layang-layang-mandi (literally the dipping swallow) to bind him hand and foot. But to his occasionally shaking his head they ascribe the effect of earthquakes. Puti-orla-bulan had afterwards, during her residence on earth, three sons and three daughters, from whom sprang the whole human race.

"The second of their deities has the rule of the air, betwixt earth and heaven, and the third that of the earth; but these two are considered as subordinate to the first. Besides these, they have as many inferior deities as there are sensible objects on earth, or circumstances in human society; of which some preside over the sea, others over rivers, over woods, over war, and the like. They believe, likewise, in four evil spirits, dwelling in four separate mountains, and whatever ill befals them, they
they attribute to the agency of one of these demons. On such occasions, they apply to one of their cunning men, who has recourse to his art, and by cutting a lemon ascertains which of these has been the author of the mischief, and by what means the evil spirit may be propitiated; which always proves to be the sacrificing a buffalo, hog, goat, or whatever animal the wizard happens on that day to be most inclined to eat. When the address is made to any of the superior and beneficent deities for assistance, and the priest directs an offering of a horse, cow, dog, hog, or fowl, care must be taken that the animal to be sacrificed is entirely white.

"They have also a vague and confused idea of the immortality of the human soul, and of a future state of happiness or misery. They say, that the soul of a dying person makes its escape through the nostrils, and is borne away by the wind; to heaven, if of a person who has led a good life; but if of an evil-doer, to a great cauldron, where it shall be exposed to fire, until such time as Batara-guru shall judge it to have suffered punishment proportioned to its sins, and feeling compassion, shall take it to himself in heaven: that finally the time shall come when the chains and bands of Naga-padoha shall be worn away, and he shall once more allow the earth to sink; that the sun will be then no more than a cubit's distance from it; and that the souls of those who, having lived well, shall remain alive at the last day, shall in like manner go to heaven, and those of the wicked, be consigned to the before-mentioned cauldron, intensely heated by the near approach of the sun’s rays, to be there tormented by a minister of Batara-guru, named Suraya-guru, until, having expiated their offences, they shall be thought worthy of reception into the heavenly regions.” To the Sanskrit scholar who shall make allowances for corrupt orthography, many of these names will be familiar. For Batara he will read avatara; and in Naga-padoha he will recognise the serpent on whom Vishnu repose.

Oaths.

Their ceremonies that wear most the appearance of religion are those practised on taking an oath, and at their funeral obsequies. A person accused of a crime, and who asserts his innocence, is in some cases acquitted upon solemnly swearing to it, but in others, is obliged to undergo
a kind of ordeal. A cock's throat is usually cut on the occasion by the guru. The accused then puts a little rice into his mouth (probably dry), and wishes it may become a stone if he be guilty of the crime with which he stands charged; or holding up a musket bullet, prays it may be his fate, in that case, to fall in battle. In more important instances they put a small leaden or tin image into the middle of a dish of rice, garnished with those bullets; when the man, kneeling down, prays that his crop of rice may fail, his cattle die, and that he himself may never take salt (a luxury as well as necessary of life), if he does not declare the truth. These tin images may be looked upon as objects of idolatrous worship; but I could not learn that any species of adoration was paid to them on other occasions, any more than to certain stone images which have been mentioned. Like the relics of saints, they are merely employed to render the form of the oath more mysterious, and thereby increase the awe with which it should be regarded.

When a raja or person of consequence dies, the funeral usually occupies several months; that is, the corpse is kept unburied until the neighbouring and distant chiefs, or, in common cases, the relations and creditors of the deceased, can be convened, in order to celebrate the rites with becoming dignity and respect. Perhaps the season of planting or of harvest intervenes, and these necessary avocations must be attended to, before the funeral ceremonies can be concluded. The body, however, is in the mean time deposited in a kind of coffin. To provide this, they fell a large tree (the anau in preference, because of the softness of the central part, whilst the outer coat is hard), and having cut a portion of the stem of sufficient length, they split it in two parts, hollow each part so as to form a receptacle for the body, and then fit them exactly together. The workmen take care to sprinkle the wood with the blood of a young hog, whose flesh is given to them as a treat. The coffin being thus prepared and brought into the house, the body is placed in it, with a mat beneath, and a cloth laid over it. Where the family can afford the expence, it is strewed over with camphor. Having now placed the two parts in close contact, they bind them together with rattans, and cover the whole with a thick coating of dammar or resin. In some instances, they take the precaution of inserting a bamboo-tube...
into the lower part, which, passing thence through the raised floor into
the ground, serves to carry off the offensive matter; so that in fact little
more than the bones remain.

When the relations and friends are assembled, each of whom brings
with him a buffalo, hog, goat, dog, fowl, or other article of provision,
according to his ability, and the women, baskets of rice, which are
presented and placed in order, the feasting begins and continues for
nine days and nights, or so long as the provisions hold out. On the last
of these days the coffin is carried out and set in an open space, where
it is surrounded by the female mourners, on their knees, with their heads
covered, and howling (ululantes) in dismal concert, whilst the younger
persons of the family are dancing near it, in solemn movement, to the
sound of gongs, kalintangs, and a kind of flageolet; at night it is returned
to the house, where the dancing and music continues, with frequent
firing of guns, and on the tenth day the body is carried to the grave,
preceded by the guru or priest, whose limbs are tattooed in the shape of
birds and beasts, and painted of different colours, with a large wooden
mask on his face. He takes a piece of buffalo-flesh, swings it about,
throwing himself into violent attitudes and strange contortions, and then
eats the morsel in a voracious manner. He then kills a fowl over the
corpse, letting the blood run down upon the coffin, and just before it
is moved, both he and the female mourners, having each a broom in
their hands, sweep violently about it, as if to chase away the evil spirits
and prevent their joining in the procession; when suddenly four men,
stationed for the purpose, lift up the coffin, and march quickly off with
it, as if escaping from the fiend; the priest continuing to sweep after it
for some distance. It is then deposited in the ground, without any
peculiar ceremony, at the depth of three or four feet; the earth about
the grave is raised, a shed built over it, further feasting takes place on
the spot, for an indefinite time, and the horns and jaw-bones of the

* It is remarkable, that in the Bisayan language of the Philippines, the term for people
so marked, whom the Spaniards call pintados, is batue. This practice is common in the
islands near the coast of Sumatra, as will hereafter be noticed. It seems to have prevailed in
many parts of the farther East, as Siam, Laos, and several of the islands.
buffaloes and other cattle devoured on the occasion, are fastened to the
posts. Mr. John and Mr. Frederick Marsden were spectators of the
funeral of a raja at Tappanuli on the main. Mr. Charles Miller men-
tions his having been present at killing the hundred and sixth buffalo
at the grave of a raja, in a part of the country where the ceremony
was sometimes continued even a year after the interment; and that
they seem to regard their ancestors as a kind of superior beings, attend-
ant always upon them.

The crimes committed here against the order and peace of society are
said not to be numerous. Theft amongst themselves is almost unknown,
being strictly honest in their dealings with each other; but when dis-
covered, the offender is made answerable for double the value of the
goods stolen. Pilfering, indeed, from strangers, when not restrained
by the laws of hospitality, they are expert at, and think no moral of-
fence; because they do not perceive that any ill results from it. Open
robbery and murder are punishable with death, if the parties are unable
to redeem their lives by a sum of money. A person guilty of man-
slaughter is obliged to bear the expence attending the interment of the
deceased and the funeral-feast given to his friends, or, if too poor to
accomplish this, it is required of his nearest relation, who is empow-
ered to reimburse himself by selling the offender as a slave. In cases
of double adultery, the man, upon detection, is punished with death,
in the manner that shall presently be described; but the woman is only
disgraced, by having her head shaven, and being sold for a slave;
which in fact she was before. This distribution of justice must proceed
upon the supposition of the females being merely passive subjects, and
of the men alone possessing the faculties of free agents. A single man
concerned in adultery with a married woman is banished or outlawed
by his own family. The lives of culprits are in almost all cases redeem-
able, if they or their connections possess property sufficient; the quan-
tum being in some measure at the discretion of the injured party. At
the same time it must be observed that Europeans not being settled
amongst these people upon the same footing as in the pepper-districts,
we are not so well acquainted either with the principle or the practice
of their laws.
SUMATRA.

The most extraordinary of the Battia customs, though certainly not peculiar to these people, remains now to be described. Many of the old travellers had furnished the world with accounts of anthropophagi or man-eaters, whom they met with in all parts of the old and new world, and their relations, true or false, were in those days, when people were addicted to the marvellous, universally credited. In the succeeding ages, when a more sceptical and scrutinizing spirit prevailed, several of these asserted facts were found upon examination to be false; and men, from a bias inherent in our nature, ran into the opposite extreme. It then became established as a philosophical truth, capable almost of demonstration, that no such race of people ever did or could exist. But the varieties, inconsistencies, and contradictions of human manners, are so numerous and glaring, that it is scarcely possible to fix any general principle that will apply to all the incongruous races of mankind, or even to conceive an irregularity to which some or other of them have not been accustomed. The voyages of our late famous circum-navigators, the veracity of whose assertions is unimpeachable, have already proved to the world that human flesh is eaten by the savages of New Zealand; and I can, with equal confidence, from conviction of the truth, though not with equal weight of authority, assert, that it is also, in these days, eaten in the island of Sumatra by the Battia people, and by them only. Whether or not the horrible custom prevailed more extensively in ancient times, I cannot take upon me to ascertain; but the same historians who mention it as practised in this island, and whose accounts were undeservedly looked upon as fabulous, relate it also of many others of the eastern people, and those of the island of Java in particular, who, since that period, may have become more humanized.

* Mention is made of the Battas and their peculiar customs by the following early writers: Nicolò di Conti, 1449. "In a certain part of this island (Sumatra) called Batech, the people eat human flesh. They are continually at war with their neighbours, preserve the skulls of their enemies as treasure, dispose of them as money, and he is accounted the richest man who has most of them in his house." Odoardus Barbossa, 1516. "There is another kingdom to the southward, which is the principal source of gold; and another inland, called Aaru (contiguous to the Battia country) where the inhabitants are pagans,
They do not eat human flesh as the means of satisfying the cravings of nature, for there can be no want of sustenance to the inhabitants of such a country and climate, who reject no animal food of any kind; nor is it sought after as a gluttonous delicacy. The Battas eat it as a species of ceremony; as a mode of shewing their detestation of certain crimes by an ignominious punishment; and as a savage display of revenge and insult to their unfortunate enemies. The objects of this barbarous repast are prisoners taken in war, especially if badly wounded, the bodies of the slain, and offenders condemned for certain capital crimes, especially for adultery. Prisoners unwounded (but they are not much disposed to give quarter) may be ransomed or sold as slaves, where the quarrel is not too inveterate; and the convicts, there is reason to believe, rarely suffer when their friends are in circumstances to redeem them by the customary equivalent of twenty binchang or eighty dollars. These are tried by the people of the tribe where the offence was committed, but cannot be executed until their own particular raja has been made acquainted with the sentence, who, when he acknowledges the justice of the intended punishment, sends a cloth to cover the head of the delinquent, together with a large dish of salt and lemons. The unhappy victim is then delivered into the hands of the injured party (if it be a private wrong, or in the case of a prisoner, to the warriors) by whom he is tied to a stake; lances are thrown at him from a certain distance by this person, his relations, and friends; and when mortally wounded, they run up to him, as if in a transport of passion, cut pieces from the body with their knives, dip them in the dish of salt, lemon-juice, and red pepper, slightly broil them over a fire prepared for the purpose, and swallow the morsels with a degree of savage enthusiasm. Sometimes (I presume, according to the degree of their animosity who eat human flesh, and chiefly of those they have slain in war.) De Barros, 1563. "The natives of that part of the island which is opposite to Malacca, who are called Battas, eat human flesh, and are the most savage and warlike of all the land." Beaulleu, 1632. "The inland people are independent, and speak a language different from the Malayan. Are idolaters, and eat human flesh; never ransom prisoners, but eat them with pepper and salt. Have no religion, but some polity." Ludovico Barthema, in 1505, asserts that the people of Java were cannibals previously to their traffic with the Chinese.
SUMATRA.

animosity and resentment) the whole is devoured by the by-standers; and instances have been known where, with barbarity still aggravated, they tear the flesh from the carcase with their teeth. To such a depth of depravity may man be plunged, when neither religion nor philosophy enlighten his steps! All that can be said in extenuation of the horror of this diabolical ceremony, is, that no view appears to be entertained of torturing the sufferers, of increasing or lengthening out the pangs of death; the whole fury is directed against the corpse, warm, indeed, with the remains of life, but past the sensation of pain. A difference of opinion has existed with respect to the practice of eating the bodies of their enemies actually slain in war; but subsequent inquiry has satisfied me of its being done, especially in the case of distinguished persons, or those who have been accessaries to the quarrel. It should be observed, that their campaigns (which may be aptly compared to the predatory excursions of our Borderers) often terminate with the loss of not more than half a dozen men on both sides. The skulls of the victims are hung up as trophies in the open buildings in front of their houses, and are occasionally ransomed by their surviving relations for a sum of money.

I have found that some persons (and among them my friend, the late Mr. Alexander Dalrymple) have entertained doubts of the reality of the fact, that human flesh is any where eaten by mankind, as a national practice, and considered the proofs hitherto adduced as insufficient to establish a point of so much moment in the history of the species. It is objected to me, that I never was an eye-witness of a Batta-feast of this nature, and that my authority for it is considerably weakened by coming through a second, or perhaps a third hand. I am sensible of the weight of this reasoning, and am not anxious to force any man’s belief, much less to deceive him by pretences to the highest degree of certainty, when my relation can only lay claim to the next degree; but I must at the same time observe, that, according to my apprehension, the refusing assent to fair, circumstantial evidence, because it clashes with a systematic opinion, is equally injurious to the cause of truth, with asserting that as positive, which is only doubtful. My conviction of the truth of what I have not personally seen (and we must all be
be convinced of facts to which neither ourselves nor those with whom we are immediately connected could ever have been witnesses) has arisen from the following circumstances, some of less and some of greater authority. It is, in the first place, a matter of general and uncontroverted notoriety throughout the island, and I have conversed with many natives of the Batta country (some of them in my own service), who acknowledged the practice, and became ashamed of it after residing amongst more humanized people. It has been my chance to have had no fewer than three brothers and brothers-in-law, beside several intimate friends (of whom some are now in England), chiefs of our settlements of Natal and Tappanuli, of whose information I availed myself, and all their accounts I have found to agree in every material point. The testimony of Mr. Charles Miller, whose name, as well as that of his father, is advantageously known to the literary world, should alone be sufficient for my purpose. In addition to what he has related in his journal, he has told me, that at one village where he halted, the suspended head of a man, whose body had been eaten a few days before, was extremely offensive; and that in conversation with some people of the Ankola district, speaking of their neighbours and occasional enemies of the Padambola district, they described them as an unprincipled race, saying, "We, indeed, eat men as a punishment for their crimes and injuries to us; but they way-lay and seize travellers, in order to ber-bantei or cut them up like cattle." It is here, obviously, the admission and not the scandal that should have weight. When Mr. Giles Holloway was leaving Tappanuli and settling his accounts with the natives, he expostulated with a Batta man who had been dilatory in his payment. "I would," says the man, "have been here sooner, but my panigulu (superior officer) was detected in familiarity with my wife. He was condemned, and I staid to eat share of him; the ceremony took us up three days, and it was only last night that we finished him." Mr. Miller was present at this conversation, and the man spoke with perfect seriousness. A native of the island of Nias who had stabbed a Batta man, in a fit of frenzy, at Batang-tara river, near Tappanuli bay, and endeavoured to make his escape, was, upon the alarm being given, seized at six in the morning, and before eleven, without any judicial process, was tied to a stake, cut in pieces with the utmost eagerness, while yet alive, and eaten upon the
spot, partly broiled, but mostly raw. His head was buried under that of the man whom he had murdered. This happened in December, 1780, when Mr. William Smith had charge of the settlement. A raja was fined by Mr. Bradley for having caused a prisoner to be eaten at a place too close to the Company's settlement, and it should have been remarked, that these feasts are never suffered to take place withinside their own kampongs. Mr. Alexander Hall made a charge in his public accounts of a sum paid to a raja as an inducement to him to spare a man whom he had seen preparing for a victim: and it is in fact this commendable dis-couragement of the practice by our government that occasions its being so rare a sight to Europeans, in a country where there are no travellers from curiosity, and where the servants of the Company having appearances to maintain, cannot by their presence, as idle spectators, give a sanction to proceedings, which it is their duty to discourage, although their influence is not sufficient to prevent them.

A Batta chief, named raja Niabin, in the year 1775, surprised a neighbouring kampong with which he was at enmity, killed the raja by stealth, carried off the body, and eat it. The injured family complained to Mr. Nairne, the English chief of Natal, and prayed for redress. He sent a message on the subject to Niabin, who returned an insolent and threatening answer. Mr. Nairne, influenced by his feelings rather than his judgment (for these people were quite removed from the Company's controul, and our interference in their quarrels was not necessary) marched with a party of fifty or sixty men, of whom twelve were Europeans, to chastise him; but on approaching the village, they found it so perfectly enclosed with growing bamboos, within which was a strong paling, that they could not even see the place or an enemy. As they advanced, however, to examine the defences, a shot from an unseen person struck Mr. Nairne in the breast, and he expired immediately. In him was lost a respectable gentleman, of great scientific acquirements, and a valuable servant of the Company. It was with much difficulty that the party was enabled to save the body. A caffree and a Malay who fell in the struggle, were afterwards eaten. Thus the experience of later days is found to agree with the uniform testimony of old writers; and although I am aware that each and every of these proofs, taken singly,
singly, may admit of some cavil, yet in the aggregate they will be thought to amount to satisfactory evidence, that human flesh is habitually eaten by a certain class of the inhabitants of Sumatra.

That this extraordinary nation has preserved the rude genuineness of its character and manners, may be attributed to various causes; as the want of the precious metals in its country, to excite the rapacity of invaders or avarice of colonists, the vegetable riches of the soil being more advantageously obtained in trade, from the unmolested labours of the natives; their total unacquaintance with navigation; the divided nature of their government, and independence of the petty chieftains, which are circumstances unfavourable to the propagation of new opinions and customs, as the contrary state of society may account for the complete conversion of the subjects of Menangkabau to the faith of Mahomet; and lastly, the ideas entertained of the ferociousness of the people, from the practices above described, which may well be supposed to have damped the ardour and restrained the zealous attempts of religious innovators.
ACHIN (properly Aceh) is the only kingdom of Sumatra that ever arrived to such a degree of political consequence in the eyes of the western people, as to occasion its transactions becoming the subject of general history. But its present condition is widely different from what it was, when by its power the Portuguese were prevented from gaining a footing in the island, and its princes received embassies from all the great potentates of Europe.

Its situation occupies the north-western extreme of the island, bordering generally on the country of the Battas; but, strictly speaking, its extent, inland, reaches no farther than about fifty miles to the southeast. Along the north and eastern coast its territory was considered, in 1778, as reaching to a place called Karti, not far distant from Batubara river, including Pidir, Samerloniga, and Pasé. On the western coast, where it formerly boasted a dominion as far down as Indrapura, and possessed complete jurisdiction at Tiku, it now extends no farther than Barus; and even there, or at the intermediate ports, although the Achinese influence is predominant, and its merchants enjoy the trade, the royal power seems to be little more than nominal. The interior inhabitants from Achin to Sinikkel are distinguished into those of Allas, Riah, and Kurrau. The Achinese manners prevail among the two former; but the last resemble the Battas, from whom they are divided by a range of mountains.

The capital stands on a river which empties itself, by several channels, near the north-west point of the island, or Achin-head, about a league from the sea, where the shipping lies in a road rendered secure by the shelter of several islands. The depth of water on the bar being no more than four feet, at low water spring-tides, only the vessels of the country
country can venture to pass it; and in the dry monsoon, not even those of the larger class. The town is situated on a plain, in a wide valley formed like an amphitheatre by lofty ranges of hills. It is said to be extremely populous, containing eight thousand houses, built of bamboos and rough timbers, standing distinct from each other, and mostly raised on piles some feet above the ground, in order to guard against the effects of inundation. The appearance of the place and nature of the buildings differ little from those of the generality of Malayan bazars, excepting that its superior wealth has occasioned the erection of a greater number of public edifices, chiefly mosques, but without the smallest pretension to magnificence. The country above the town is highly cultivated, and abounds with small villages, and groups of three or four houses, with white mosques interspersed. The king's palace, if it deserves the appellation, is a very rude and uncouth piece of architecture, designed to resist the attacks of internal enemies, and surrounded for that purpose with

\* The following description of the appearance of Achin, by a jesuit missionary who touched there in his way to China in 1695, is so picturesque, and at the same time so just, that I shall make no apology for introducing it. "Imaginez vous une forêt de cocotiers, de bambous, d'ananas, de bagnaniers, au milieu de laquelle passe une assez belle rivière toute couverte de bateaux; mettez dans cette forêt une nombre incroyable de maisons faites avec de cannes, de roseaux, des ecorces, et disposez les de telle manière qu'elles forment tantôt des rues, et tantôt des quartiers séparés: coupez ces divers quartiers de prairies & de bois: repandez par tout dans cette grande forêt, autant d'hommes qu'on en voit dans nos villes, lorsqu'elles sont bien peuplées; vous vous formerez une idée assez juste d'Achen; et vous conviendrez qu'une ville de ce goût nouveau peut faire plaisir à des étrangers qui passent. Elle me parût d'abord comme ces paysages sortis de l'imagination d'un peintre ou d'un poète, qui rassemble sous un coup d'œil, tout ce que la campagne a de plus riant. Tout est négligé et naturel, champêtre et même un peu sauvage. Quand on est dans la rade, où n'apparait aucun vestige, ni aucune apparence de ville, parceque des grands arbres qui bordent le rivage en cachent toutes les maisons; mais outre le paysage qui est très-beau, rien n'est plus agréable que de voir de matin un infinithé de petits bateaux de pêcheurs qui sortent de la rivière avec le jour, et qui ne rentrent que le soir, lorsque le soleil se couche. Vous diriez un essaim d'abeilles qui reviennent à la cruche chargées du fruit de leur travail." Lettres Edifiantes, Tom. I. For a more modern account of this city I beg leave to refer the reader to Capt. Thomas Forrest's Voyage to the Mergui Archipelago, p. 38 to 60, where he will find a lively and natural description of every thing worthy of observation in the place, with a detail of the circumstances attending his own reception at the court, illustrated with an excellent plate.
with a moat and strong walls, but without any regular plan, or view to the modern system of military defence."

Air. The air is esteemed comparatively healthy, the country being more free from woods and stagnant water than most other parts; and fevers and dysenteries, to which these local circumstances are supposed to give occasion, are there said to be uncommon. But this must not be too readily credited; for the degree of insalubrity attending situations in that climate is known so frequently to alter, from inscrutable causes, that a person who has resided only two or three years on a spot, cannot pretend to form a judgment; and the natives, from a natural partiality, are always ready to extol the healthiness, as well as other imputed advantages, of their native places.

Inhabitants. The Acheenese differ much in their persons from the other Sumatrans, being in general taller, stouter, and of darker complexions. They are by no means, in their present state, a genuine people, but thought, with great appearance of reason, to be a mixture of Battas and Malays, with chulias, as they term the natives of the west of India, by whom their ports have in all ages been frequented. In their dispositions they are more active and industrious than some of their neighbours; they possess more sagacity, have more knowledge of other countries, and as merchants they deal upon a more extensive and liberal footing. But this last observation applies rather to the traders at a distance from the capital and to their transactions, than to the conduct observed at Achin, which, according to the temper and example of the reigning monarch, is often narrow, extortionary, and oppressive. Their language is one of the general dialects of the eastern islands, and its affinity to the Battas may

* Near the gate of the palace are several pieces of brass ordnance of an extraordinary size; of which some are Portuguese; but two in particular, of English make, attract curiosity. They were sent by King James the first to the reigning monarch of Acheen, and have still the founder's name, and the date, legible upon them. The diameter of the bore of one is eighteen inches; of the other twenty-two or twenty-four. Their strength, however, does not appear to be in proportion to the calibre, nor do they seem in other respects to be of adequate dimensions. James, who abhorred bloodshed himself, was resolved that his present should not be the instrument of it to others.
may be observed in the comparative table; but they make use of the Malayan character. In religion they are Mahometans, and having many priests, and much intercourse with foreigners of the same faith, its forms and ceremonies are observed with some strictness.

Although no longer the great mart of eastern commodities, Achin still carries on a considerable trade, as well with private European merchants, as with the natives of that part of the coast of India called Telinga, which is properly the country lying between the Kistna and Godavery rivers; but the name, corrupted by the Malays to Kling, is commonly applied to the whole coast of Coromandel. These supply it with salt, cotton piece-goods, principally those called long-cloth white and blue, and chintz with dark grounds; receiving in return gold-dust, raw-silk of inferior quality, betel-nut, patch-leaf (melissa lotoria, called dilam by the Malays) pepper, sulphur, camphor, and benzoin. The two latter are carried thither from the river of Singkel, where they are procured from the country of the Battas, and the pepper from Pider; but this article is also exported from Susu, to the amount of about two thousand tons annually, where it sells at the rate of twelve dollars the pikul, chiefly for gold and silver. The quality is not esteemed good, being gathered before it is sufficiently ripe, and it is not cleaned like the Company's pepper. The Americans have been of late years the chief purchasers. The gold collected at Achin comes partly from the mountains in the neighbourhood, but chiefly from Nalabu and Susu. Its commerce, independently of that of the out-ports, gives employment to from eight to ten Kling vessels, of an hundred and fifty or two hundred tons burthen, which arrive annually from Porto Novo and Coringa about the month of August, and sail again in February and March. These are not permitted to touch at any places under the king's jurisdiction, on the eastern or western coast, as it would be injurious to the profits of his trade, as well as to his revenue from the customs and from the presents exacted on the arrival of vessels, and for which his officers at those distant places would not account with him. It must be understood that the king of Achin, as is usual with the princes of this part of the world, is the chief merchant of his capital, and endeavours to be, to the utmost of his power, the monopolizer of its trade; but this he cannot at
at all times effect, and the attempt has been the cause of frequent rebellions. There is likewise a ship or two from Surat every year, the property of native merchants there. The country is supplied with opium, taffetas, and muslins from Bengal, and also with iron, and many other articles of merchandise, by the European traders.

The soil being light and fertile produces abundance of rice, esculent vegetables, much cotton, and the finest tropical fruits. Both the mango and mangustin are said to be of excellent quality. Cattle and other articles of provision are in plenty, and reasonable in price. The plough is there drawn by oxen, and the general style of cultivation shows a skill in agriculture superior to what is seen in other parts of the island.

Those few arts and manufactures which are known in other parts of the island prevail likewise here, and some of them are carried to more perfection. A considerable fabric of a thick species of cotton cloth, and of striped or chequered stuff for the short drawers worn both by Malays and Achinese, is established here, and supplies an extensive foreign demand, particularly in the Rau country, where they form part of the dress of the women as well as men. They weave also very handsome and rich silk pieces, of a particular form, for that part of the body-dress which the Malays call kain sarong; but this manufacture had much decreased at the period when my inquiries were made, owing, as the people said, to an unavoidable failure in the breed of silk-worms, but more probably to the decay of industry amongst themselves, proceeding from their continual civil disturbances.

They are expert and bold navigators, and employ a variety of vessels, according to the voyages they have occasion to undertake, and the purposes either of commerce or war for which they design them. The river is covered with a number of small fishing vessels, which go to sea with the morning breeze, and return in the afternoon, with the sea-wind, full laden. These are named koleh, are raised about two streaks on a sampan bottom, have one mast, and an upright or square sail, but long in proportion to its breadth, which rolls up. These sometimes make their appearance
appearance so far to the southward as Bencoolen. The banting is a trading vessel, of a larger class, having two masts, with upright sails like the former, rising at the stem and stern, and somewhat resembling a Chinese junk, excepting in its size. They have also very long narrow boats, with two masts, and double or single out-riggers, called balābang and jalōr. These are chiefly used as war-boats, mount guns of the size of swivels, and carry a number of men. For representations of various kinds of vessels employed by these eastern people, the reader is referred to the plates in Capt. Forrest’s two voyages.

They have a small, thin, adulterated gold coin, rudely stamped with Arabic characters, called mas or massiah. Its current value is said to be about fifteen, and its intrinsic, about twelve-pence, or five Madras fanams. Eighty of these are equal to the bangkal, of which twenty make a katti. The tāil, here an imaginary valuation, is one-fifth of the bangkal, and equal to sixteen mas. The small leaden money, called pitis or cash, is likewise struck here for the service of the bazar; but neither these nor the former afford any convenience to the foreign trader. Dollars and rupihs pass current, and most other species of coin are taken at a valuation; but payments are commonly made in gold dust, and for that purpose every one is provided with small scales or steelyards, called daching. They carry their gold about them, wrapped in small pieces of bladder (or rather the integument of the heart), and often make purchases to so small an amount, as to employ grains of padi or other seeds for weights.

The monarchy is hereditary, and is more or less absolute, in proportion to the talents of the reigning prince; no other bounds being set to his authority, than the counterbalance or check it meets with, from the power of the great vassals, and disaffection of the commonalty. But this resistance is exerted in so irregular a manner, and with so little view to the public good, that nothing like liberty results from it. They experience only an alternative of tyranny and anarchy, or the former under different shapes. Many of the other Sumatran people are in the possession of a very high degree of freedom, founded upon a rigid attachment to their old established customs and laws. The king usually
SUMATRA.

maintains a guard of an hundred sepoys (from the Coromandel coast) about his palace, but pays them indifferently.

The grand council of the nation consists of the king or Sultan, the maharaja, laksamana, padukatuan, and bandhara. Inferior in rank to these, are the ulubalangs or military champions, among whom are several gradations of rank, who sit on the king's right hand, and other officers named kajuran, who sit on his left. At his feet sits a woman, to whom he makes known his pleasure: by her it is communicated to an eunuch, who sits next to her, and by him to an officer, named Kajuran Gondang, who then proclaims it aloud to the assembly. There are also present two other officers, one of whom has the government of the Bazar or market, and the other, the superintending and carrying into execution the punishment of criminals. All matters relative to commerce and the customs of the port come under the jurisdiction of the Shabandar, who performs the ceremony of giving the chap or licence for trade; which is done by lifting a golden-hafted kris over the head of the merchant who arrives, and without which he dares not to land his goods. Presents, the value of which are become pretty regularly ascertained, are then sent to the king and his officers. If the stranger be in the style of an ambassador, the royal elephants are sent down to carry him and his letters to the monarch's presence; these being first delivered into the hands of an eunuch, who places them in a silver dish, covered with rich silk, on the back of the largest elephant, which is provided with a machine (houdar) for that purpose. Within about an hundred yards of an open hall where the king sits, the cavalcade stops, and the ambassador dismounts, and makes his obeisance by bending his body and lifting his joined hands to his head. When he enters the palace, if an European, he is obliged to take off his shoes, and having made a second obeisance, is seated upon a carpet on the floor, where betel is brought to him. The throne was some years ago of ivory and tortoise-shell; and when the place was governed by queens, a curtain of gauze was hung before it, which did not obstruct the audience, but prevented any perfect view. The stranger, after some general discourse, is then conducted to a separate building, where he is entertained with the delicacies of the country, by the officers of state, and in the evening returns in the manner he came, surrounded
surrounded by a prodigious number of lights. On high days (*ari raya*) the king goes in great state, mounted on an elephant richly caparisoned, to the great mosque, preceded by his *ulubalangs*; who are armed nearly in the European manner.

The whole kingdom is divided into certain small districts or communities, called *mukim*, which seem to be equivalent to our parishes, and their number is reckoned at one hundred and ninety, of which seventy-three are situated in the valley of *Achin*. Of these last are formed three larger districts, named *Duo-puluh duo* (twenty-two), *Duo-puluh-limo* (twenty-five), and *Duo-puluh-anam* (twenty-six), from the number of *mukims* they respectively contain; each of which is governed by a *païg-lima* or provincial governor, with an *imâm* and four *païgichis* for the service of each mosque. The country is extremely populous; but the computations with which I have been furnished exceed so far all probability, that I do not venture to insert them.

The regular tax or imposition to which the country is subject, for the use of the crown, is one *koyan* (about eight hundred gallons) of *padi* from each *mukim*, with a bag of rice, and about the value of one Spanish dollar and an half in money, from each proprietor of a house, to be delivered at the king's store in person; in return for which homage, he never fails to receive nearly an equivalent in tobacco or some other article. On certain great festivals presents of cattle are made to the king by the *orang-kayas* or nobles; but it is from the import and export customs on merchandise, that the revenue of the crown properly arises, and which of course fluctuates considerably. What Europeans pay is between five and six per cent.; but the *Kling* merchants are understood to be charged with much higher duties; in the whole not less than fifteen, of which twelve in the hundred are taken out of the bales in the first instance; a disparity they are enabled to support by the provident and frugal manner in which they purchase their investments, the cheap rate at which they navigate their vessels, and the manner of retailing their goods to the natives. These sources of wealth are independent of the profit derived from the trade, which is managed for his master by a 3 F 2 person
person who is stiyyed the king's merchant. The revenues of the nobles accrue from taxes which they lay, as feudal lords, upon the produce of the land cultivated by their vassals. At Pidir a measure of rice is paid for every measure of padi sown, which amounts to about a twentieth part. At Nalabu there is a capitation tax of a dollar a year; and at various places on the inland roads there are tolls collected upon provisions and goods which pass to the capital.

The kings of Achin possess a grant of territory along the sea-coast, as far down as Bencoolen, from the sultan of Menaiğkabau, whose superiority has always been admitted by them, and will be, perhaps, so long as he claims no authority over them, and exacts neither tribute nor homage.

Achin has ever been remarkable for the severity with which crimes are punished by their laws; the same rigour still subsists, and there is no commutation admitted, as is regularly established in the southern countries. There is great reason, however, to conclude, that the poor alone experience the rod of justice; the nobles being secure from retribution in the number of their dependants. Petty theft is punished by suspending the criminal from a tree, with a gun or heavy weight tied to his feet; or by cutting off a finger, a hand, or leg, according to the nature of the theft. Many of these mutilated, and wretched objects, are daily to be seen in the streets. Robbery, on the highway and housebreaking, are punished by drowning, and afterwards exposing the body on a stake for a few days. If the robbery is committed upon an imām or priest, the sacrilege is expiated by burning the criminal alive. A man who is convicted of adultery or rape, is seldom attempted to be screened by his friends, but is delivered up to the friends and relations of the injured husband or father. These take him to some large plain, and forming themselves in a circle, place him in the middle. A large weapon, called a gadubong, is then delivered to him by one of his family, and if he can force his way through those who surround him, and make his escape, he is not liable to further prosecution; but it commonly happens that he is instantly cut to pieces. In this case his relations bury him as they would a dead buffalo, refusing to admit the corpse into their house, or
to perform any funeral rites. Would it not be reasonable to conclude, that the Achinese, with so much discouragement to vice, both from law and prejudice, must prove a moral and virtuous people? yet all travellers agree in representing them as one of the most dishonest and flagitious nations of the East; which the history of their government will tend to corroborate.
Proceedings of the Portuguese.

The Portuguese, under the conduct of Vasco de Gama, doubled the Cape of Good Hope in the year 1497, and arrived on the coast of Malabar in the following year. These people, whom the spirit of glory, commerce, and plunder, led to the most magnanimous undertakings, were not so entirely engaged by their conquests on the continent of India as to prevent them from extending their views to the discovery of regions yet more distant. They learned from the merchants of Guzerat some account of the riches and importance of Malacca, a great trading city in the farther peninsula of India, supposed by them the Golden Chersonese of Ptolemy. Intelligence of this was transmitted to their enterprising sovereign, Emanuel, who became impressed with a strong desire to avail himself of the flattering advantages which this celebrated country held out to his ambition. He equipped a fleet of four ships under the command of Diogo Lopez Sequeira, which sailed from Lisbon on the eighth day of April, 1508, with orders to explore, and establish connexions in those eastern parts of Asia. After touching at Madagascar, Sequeira proceeded to Cochin, where a ship was added to his fleet, and departing from thence on the eighth of September, 1509, he made sail towards Malacca; but having doubled the extreme promontory of Sumatra (then supposed to be the Taprobane of the ancients) he anchored at Pidir, a principal port of that island, in which he found vessels from Pegu, Bengal, and other countries. The king of the place, who, like other Mahometan princes, was styled sultan, sent off a deputation to him, accompanied with refreshments, excusing himself, on account of illness, from paying his compliments in person, but assuring him at the same time that he should derive much pleasure from the friendship and alliance of the Portuguese, whose fame had reached his ears. Sequeira answered this message in such terms, that, by consent of the sultan, a monument of
of their amity was erected on the shore; or more properly, as the token of discovery and possession usually employed by the European nations. He was received in the same manner at a place called Pasē, lying about twenty leagues farther to the eastward on the same coast, and there also erected a monument or cross. Having procured at each of these ports as much pepper as could be collected in a short time, he hastened to Malacca, where the news of his appearance in these seas had anticipated his arrival. Here he was near falling a sacrifice to the insidious policy of Mahmud, the reigning king, to whom the Portuguese had been represented by the Arabian and Persian merchants, (and not very unjustly) as lawless pirates, who, under the pretext of establishing commercial treaties, had, at first by encroachments, and afterwards with insolent rapacity, ruined and enslaved the princes who were weak enough to put a confidence in them, or to allow them a footing in their dominions. He escaped the snares that were laid for him, but lost many of his people, and leaving others in captivity, he returned to Europe, and gave an account of his proceedings to the king.

A fleet was sent out, in the year 1510, under Diogo Mendez, to establish the Portuguese interests at Malacca; but Affonso d'Alboquerque, the governor of their affairs in India, thought proper to detain this squadron on the coast of Malabar, until he could proceed thither himself with a greater force; and accordingly on the second of May, 1511, he set sail from Cochin with nineteen ships and fourteen hundred men. He touched at Pidir, where he found some of his countrymen, who had made their escape from Malacca in a boat, and sought protection on the Sumatran shore. They represented, that, arriving off Pasē, they had been ill-treated by the natives, who killed one of their party, and obliged them to fly to Pidir, where they met with hospitality and kindness from the prince, who seemed desirous to conciliate the regard of their nation. Alboquerque expressed himself sensible of this instance of friendship, and renewed with the sultan the alliance that had been formed by Sequeira. He then proceeded to Pasē, whose monarch endeavoured to exculpate himself from the outrage committed against the Portuguese fugitives, and as he could not tarry to take redress, he concealed his resentment. In crossing over to Malacca, he fell in with
a large junk, or country vessel, which he engaged, and attempted to board; but the enemy setting fire to a quantity of inflammable, oleaginous matter, he was deterred from his design, with a narrow escape of the destruction of his own ship. The junk was then battered from a distance, until forty of her men were killed, when Alboquerque, admiring the bravery of the crew, proposed to them, that if they would strike, and acknowledge themselves vassals of Portugal, he would treat them as friends, and take them under his protection. This offer was accepted, and the valiant defender of the vessel informed the governor, that his name was Jeinal, the lawful heir of the kingdom of Pasê; he by whom it was then ruled being an usurper, who, taking advantage of his minority, and his own situation as regent, had seized the crown: that he had made attempts to assert his rights, but had been defeated in two battles, and was now proceeding with his adherents to Java, some of the princes of which were his relations, and would, he hoped, enable him to obtain possession of his throne. Alboquerque promised to effect it for him, and desired the prince to accompany him to Malacca, where they arrived the first of July, 1511. In order to save the lives of the Portuguese prisoners, and if possible to effect their recovery, he negotiated with the king of Malacca before he proceeded to an attack on the place; which conduct of his, Jeinal construed into fear, and, forsaking his new friend, passed over in the night to the Malayan monarch, whose protection he thought of more consequence to him. When Alboquerque had subdued the place, which made a vigorous resistance, the prince of Pasê, seeing the errour of his policy, returned, and threw himself at the governor's feet, acknowledged his injurious mistrust, and implored his pardon; which was not denied him. He doubted, however, it seems, of a sincere reconciliation and forgiveness, and perceiving that no measures were taking for restoring him to his kingdom, but, on the contrary, that Alboquerque was preparing to leave Malacca with a small force, and talked of performing his promise when he should return from Goa, he took the resolution of again attaching himself to the fortunes of the conquered monarch, and secretly collecting his dependants, fled once more from the protection of the Portuguese. He probably was not insensible that the reigning king of Pasê, his adversary, had for some time taken abundant pains to procure the favour of Alboquerque, and found
found an occasion of demonstrating his zeal. The governor, on his return from Malacca, met with a violent storm on the coast of Sumatra, near the point of Timiang, where his ship was wrecked. Part of the crew making a raft were driven to Pasé, where the king treated them with kindness, and sent them to the coast of Coromandel by a merchant ship. Some years after these events, Jeinal was enabled by his friends to carry a force to Pasé, and obtained the ascendancy there, but did not long enjoy his power.

Upon the reduction of Malacca, the governor received messages from several of the Sumatran princes, and amongst the rest from the king of a place called Kampar, on the eastern coast, who had married a daughter of the king of Malacca, but was on ill terms with his father-in-law. He desired to become a vassal of the Portuguese crown, and to have leave to reside under their jurisdiction. His view was to obtain the important office of bandhara, or chief magistrate of the Malays, lately vacant by the execution of him who possessed it. He sent before him a present of lignum-aloes and gum-lac, the produce of his country; but Alboquerque suspecting the honesty of his intentions, and fearing that he either aspired to the crown of Malacca, or designed to entice the merchants to resort to his own kingdom, refused to permit his coming, and gave the superintendence of the natives to a person named Nina Chetuan.

After some years had elapsed, at the time when Jorge Alboquerque was governor of Malacca, this king (Abdallah by name) persisting in his views, paid him a visit, and was honourably received. At his departure, he had assurances given him of liberty to establish himself at Malacca, if he should think proper, and Nina Chetuan was shortly afterwards removed from his office, though no fault was alleged against him. He took the disgrace so much to heart, that causing a pile to be erected before his door, and setting fire to it, he threw himself into the flames. The intention of appointing Abdallah to the office of bandhara was quickly rumoured abroad, and coming to the knowledge of the

1 This man was not a Mahometan, but one of the unconverted natives of the peninsula, who are always distinguished from the Moors by the Portuguese writers.
the king of Bintang, who was driven from Malacca, and now carried on a vigorous war against the Portuguese, under the command of the famous Laksamana, he resolved to prevent his arrival there. For this purpose he leagued himself with the king of Lingga, a neighbouring island, and sent out a fleet of seventy armed boats to block up the port of Kampar. By the valour of a small Portuguese armament, this force was overcome in the river of that name, and the king conducted in triumph to Malacca, where he was invested in form with the important post he aspired to. But this sacrifice of his independance proved an unfortunate measure to him; for although he conducted himself in such a manner as should have given the ampest satisfaction, and appears to have been irreproachable in the execution of his trust, yet in the following year the king of Bintang found means to inspire the governor with diffidence of his fidelity, and jealousy of his power. He was cruelly sentenced to death, without the simplest forms of justice, and perished in the presence of an indignant multitude, whilst he called heaven to witness his innocence, and direct its vengeance against his interested accusers. This iniquitous and impolitic proceeding had such an effect upon the minds of the people, that all of any property or repute forsook the place, execrating the government of the Portuguese. The consequences of this general odium reduced them to extreme difficulties for provisions, which the neighbouring countries refused to supply them with, and but for some grain at length procured from Siak, with much trouble, the event had proved fatal to the garrison.

Fernando Perez d’Andrade, in his way to China, touched at Pasë, in order to take in pepper. He found the people of the place, as well as the merchants from Bengal, Cambay, and other parts of India, much discontented with the measures then pursuing by the government of Malacca, which had stationed an armed force to oblige all vessels to resort thither with their merchandise, and take in at that place, as an emporium, the cargoes they were used to collect in the straits. The king, notwithstanding, received Andrade well, and consented that the Portuguese should have liberty to erect a fortress in his kingdom.

Extraordinary accounts having been related of certain islands abounding
PROCEEDING along the western coast of the island of Sumatra, a ship and a small brigantine, under the command of Diogo Pacheco, an experienced seaman, were sent in order to make the discovery of them. Having proceeded as far as Daya, the brigantine was lost in a gale of wind. Pacheco stood on to Barus, a place renowned for its gold trade, and for gum benzoin of a peculiar scent, which the country produced. It was much frequented by vessels, both from the neighbouring ports in the island, and from those in the West of India, whence it was supplied with cotton cloths. The merchants, terrified at the approach of the Portuguese, forsook their ships, and fled precipitately to the shore. The chiefs of the country sent to inquire the motives of his visit, which he informed them were to establish friendly connexions, and to give them assurances of un molested freedom of trade at the city of Malacca. Refreshments were then ordered for his fleet, and upon landing he was treated with respect by the inhabitants, who brought the articles of their country to exchange with him for merchandise. His chief view was to obtain information respecting the situation and other circumstances of the ilhas d'Ouro; but they seemed jealous of imparting any. At length, after giving him a laboured detail of the dangers attending the navigation of the seas where they were said to lie, they represented their situation to be distant an hundred leagues, to the south-east of Barus, amidst labyrinths of shoals and reefs, through which it was impossible to steer with any but the smallest boats. If these islands, so celebrated about this time, existed any where but in the regions of fancy, they were probably those of Tiku, to which it is possible that much gold might be brought from the neighbouring country of Menaṅgkaban. Pacheco leaving Barus, proceeded to the southward, but did not make the wished for discovery. He reached the channel that divides Sumatra from Java, which he called the strait of Polimban, from a city he erroneously supposed to lie on the Javan shore, and passing through this, returned to Malacca by the east; being the first European who sailed round the island.

* Linschoten makes particular mention of having seen them, and gives practical directions for the navigation, but the golden dreams of the Portuguese were never realized in them.
island of Sumatra. In the following year he sailed once more in search of these islands, which were afterwards the object of many fruitless voyages; but touching again at Barus, he met with resistance there, and perished with all his companions.

A little before this time, a ship under the command of Gaspar d'Acosta was lost on the island of Gamisopa (pulo Gomez) near Achin head, when the people from Achin attacked and plundered the crew, killing many, and taking the rest prisoners. A ship also which belonged to Joano de Lima, was plundered in the road, and the Portuguese which belonged to her put to death. These insults, and others committed at Pase, induced the governor of Malacca, Garcia de Sa, to dispatch a vessel under Manuel Pacheco, to take satisfaction; which he endeavoured to effect by blocking up the ports, and depriving the towns of all sources of provision, particularly their fisheries. As he cruised between Achin and Pase, a boat with five men going to take in fresh water at a river nigh to the latter, would have been cut off, had not the people, by wonderful efforts of valour, overcome the numerous party which attacked them. The sultan, alarmed for the consequences of this affray, sent immediately to sue for reconciliation, offering to make atonement for the loss of property the merchants had sustained by the licentiousness of his people, from a participation in whose crimes he sought to vindicate himself. The advantage derived from the connexion with this place, induced the government of Malacca to be satisfied with his apology, and cargoes of pepper and raw-silk were shortly after procured there; the former being much wanted for the ships bound to China.

Jeinal, who had fled to the king of Malacca, as before mentioned, followed that monarch to the island of Bintang, and received one of his daughters in marriage. Six or seven years elapsed before the situation of affairs enabled the king to lend him any effectual assistance, but at length some advantages gained over the Portuguese afforded a proper opportunity, and accordingly a fleet was fitted out, with which Jeinal sailed for Pase. In order to form a judgment of the transactions of this kingdom, it must be understood, that the people having an idea of predestination, always conceived present possession to constitute right, however
however that possession might have been acquired; but yet they made no scruple of deposing and murdering their sovereigns, and justified their acts by this argument; that the fate of concerns so important as the lives of kings, was in the hands of God, whose vicegerents they were, and that if it was not agreeable to him, and the consequence of his will, that they should perish by the daggers of their subjects, it could not so happen. Thus it appears, that their religious ideas were just strong enough to banish from their minds every moral sentiment. The natural consequence of these maxims was, that their kings were merely the tyrants of the day; and it is said, that whilst a certain ship remained in the port, no less than two were murdered, and a third set up: but allowance should, perhaps, be made for the medium through which these accounts have been transmitted to us.

The maternal uncle of Jeinal, who, on account of his father's infirmities, had been some time regent, and had deprived him of the succession to the throne, was also king of Aru or Rou, a country not far distant, and thus became monarch of both places. The caprices of the Pasë people, who submitted quietly to his usurpation, rendered them long discontented with his government, and being a stranger, they had the less compunction in putting him to death. Another king was set up in his room, who soon fell by the hands of some natives of Aru who resided at Pasë, in revenge for the assassination of their countryman. A fresh monarch was elected by the people, and in his reign it was that Jeinal appeared with a force from Bintang, who, carrying every thing before him, put his rival to death, and took possession of the throne. The son of the deceased, a youth of about twelve years of age, made his escape, accompanied by the Mulana or chief priest of the city, and procured a conveyance to the west of India. There they threw themselves at the feet of the Portuguese governor, Lopez Sequeira, then engaged in an expedition to the Red Sea, imploring his aid to drive the invader from their country, and to establish the young prince in his rights, who would thenceforth consider himself as a vassal of the crown of Portugal. It was urged that Jeinal, as being nearly allied to the king of Bintang, was an avowed enemy to that nation, which he had manifested in some recent outrages committed against the merchants from Malacca.
Malacca who traded at *Pasë*. Sequeira, partly from compassion, and partly from political motives, resolved to succour this prince, and by placing him on the throne, establish a firm interest in the affairs of his kingdom. He accordingly gave orders to Jorge Alboquerque, who was then proceeding with a strong fleet towards Malacca, to take the youth with him, whose name was *Orfacam*, and after having expelled *Jeinal*, to put him in possession of the sovereignty.

When *Jeinal* entered upon the administration of the political concerns of the kingdom, although he had promised his father-in-law to carry on the war in concert with him, yet, being apprehensive of the effects of the Portuguese power, he judged it more for his interest to seek a reconciliation with them, than to provoke their resentment, and in pursuance of that system, had so far recommended himself to Garcia de Sa, the governor of Malacca, that he formed a treaty of alliance with him. This was, however, soon interrupted, and chiefly by the imprudence of a man named Diogo Vaz, who made use of such insulting language to the king, because he delayed payment of a sum of money he owed him, that the courtiers, seized with indignation, immediately stabbed him with their krises, and the alarm running through the city, others of the Portuguese were likewise murdered. The news of this affair reaching Goa, was an additional motive for the resolution taken of dethroning him.

Jorge d’Alboquerque arrived at *Pasë* in 1521, with prince *Orfacam*, and the inhabitants, came off in great numbers to welcome his return. The king of *Aru* had brought thither a considerable force the preceding day, designing to take satisfaction for the murder of his relation, the uncle of *Jeinal*, and now proposed to Alboquerque that they should make the attack in conjunction, who thought proper to decline it. *Jeinal*, although he well knew the intention of the enemy, yet sent a friendly message to Alboquerque, who in answer required him to relinquish his

---

* Evidently corrupted, as are most of the country names and titles; which shews that the Portuguese were not at this period much conversant in the Malayan language.
his crown in favour of him whom he styled the lawful prince. He then represented to him the injustice of attempting to force him from the possession of what was his, not only by right of conquest, but of hereditary descent, as was well known to the governor himself; that he was willing to consider himself as the vassal of the king of Portugal, and to grant every advantage in point of trade, that they could expect from the administration of his rival; and that since his obtaining the crown he had manifested the utmost friendship to the Portuguese, for which he appealed to the treaty formed with him by the government of Malacca, which was not disturbed by any fault that could in justice be imputed to himself. These arguments, like all others that pass between states which harbour inimical designs, had no effect upon Alboquerque, who, after reconnoitring the ground, gave orders for the attack. The king was now sensible that there was nothing left for him but to conquer or die, and resolved to defend himself to extremity, in an entrenchment he had formed at some distance from the town of Pasê, where he had never yet ventured to reside, as the people were in general incensed against him on account of the destruction of the late king of their choice; for though they were ever ready to demolish those whom they disliked, yet were they equally zealous to sacrifice their own lives, in the cause of those to whom they were attached. The Portuguese force consisted but of three hundred men, yet such was the superiority they possessed in war over the inhabitants of these countries, that they entirely routed Jeinal's army, which amounted to three thousand, with many elephants, although they fought bravely. When he fell, they became dispirited, and the people of Aru joining in the pursuit, a dreadful slaughter succeeded, and upwards of two thousand Sumatrans lay dead, with the loss of only five or six Europeans; but several were wounded, among whom was Alboquerque himself.

The next measure was to place the young prince upon the throne, which was performed with much ceremony. The mulana was appointed his governor, and Nina Cunapan, who in several instances had shewn a friendship for the Portuguese, was continued in the office of Shabbandar. It was stipulated, that the prince should do homage to the crown of Portugal; give a grant of the whole produce of pepper of
his country at a certain price; and defray the charges of a fortress which they then prepared to erect in his kingdom, and of which Miranda d’Azeuedo was appointed captain, with a garrison of an hundred soldiers. The materials were mostly timber, with which the ruins of Jeimal’s entrenchment supplied them. After Alboquerque’s departure, the works had nearly fallen into the hands of an enemy, named Melek-el-adil, who called himself sultan of Pasé, and made several desultory attacks upon them; but he was at length totally routed, and the fortifications were completed without further molestation.

A fleet which sailed from the west of India a short time after that of Alboquerque, under the command of Jorge de Brito, anchored in the road of Achin, in their way to the Molucca islands. There was at this time at that place a man of the name of Joano Borba, who spoke the language of the country, having formerly fled thither from Pasé, when Diogo Vaz was assassinated. Being afterwards intrusted with the command of a trading vessel from Goa, which foundered at sea, he again reached Achin, with nine men in a small boat, and was hospitably received by the king, when he learned that the ship had been destined to his port. Borba came off to the fleet along with a messenger sent by the king to welcome the commander, and offer him refreshments for his fleet, and being a man of extraordinary loquacity, he gave a pompous description to Brito of a temple in the country in which was deposited a large quantity of gold: he mentioned likewise that the king was in possession of the artillery and merchandise of Gaspar d’Acosta’s vessel, some time since wrecked there; and also of the goods saved from a brigantaine driven on shore at Daya, in Pacheco’s expedition; as well as of Joano de Lima’s ship, which he had caused to be cut off. Brito being tempted by the golden prize, which he conceived already in his power, and inflamed by Borba’s representation of the king’s iniquities, sent a message in return, to demand the restitution of the artillery, ship, and goods, which had been unlawfully seized. The king replied, that if he wanted those articles to be refunded, he must make his demand to the sea which had swallowed them up. Brito and his captains now resolved to proceed to an attack upon the place, and so secure did they make themselves of their prey, that they refused permission
permission to a ship lately arrived, and which did not belong to their squadron, to join them or participate in the profits of their adventure. They prepared to land two hundred men in small boats; a larger, with a more considerable detachment and their artillery, being ordered to follow. About day break they had proceeded half way up the river, and came near to a little fort designed to defend the passage, where Brito thought it advisable to stop till the remainder of their force should join them; but being importuned by his people, he advanced to make himself master of the fort, which was readily effected. Here he again resolved to make his stand, but by the imprudence of his ensign, who had drawn some of the party into a skirmish with the Achinese, he was forced to quit that post in order to save his colours, which were in danger. At this juncture the king appeared at the head of eight hundred or a thousand men, and six elephants. A desperate conflict ensued, in which the Portuguese received considerable injury. Brito sent orders for the party he had left to come up, and endeavoured to retreat to the fort, but he found himself so situated, that it could not be executed without much loss, and presently after he received a wound from an arrow through the cheeks. No assistance arriving, it was proposed that they should retire in the best manner they could to their boats; but this Brito would not consent to, preferring death to flight, and immediately a lance pierced his thighs, and he fell to the ground. The Portuguese, rendered desperate, renewed the combat with redoubled vigour, all crowding to the spot where their commander lay, but their exertions availed them nothing against such unequal force, and they only rushed on to sacrifice. Almost every man was killed, and among these were near fifty persons of family, who had embarked as volunteers. Those who escaped belonged chiefly to the corps-de-reserve, who did not, or could not, come up in time to succour their unfortunate companions. Upon this merited defeat, the squadron immediately weighed anchor, and after falling in with two vessels bound on the discovery of the ilhas d'Ouro, arrived at Pasé, where they found Alboquerque employed in the construction of his fortress, and went with him to make an attack on Bintang.

At the period when Malacca fell into the hands of the Portuguese, 
Achin and Daya are said by the historians of that nation to have been provinces
provinces subject to Pidir, and governed by two slaves belonging to the sultan of that place, to each of whom he had given a niece in marriage. Slaves, it must be understood, are in that country on a different footing from those in most other parts of the world, and usually treated as children of the family. Some of them are natives of the continent of India, whom their masters employ to trade for them; allowing them a certain proportion of the profits, and permission to reside in a separate quarter of the city. It frequently happened also, that men of good birth, finding it necessary to obtain the protection of some person in power, became voluntary slaves for this purpose, and the nobles, being proud of such dependants, encouraged the practice by treating them with a degree of respect, and in many instances they made them their heirs. The slave of this description who held the government of Achin, had two sons, the elder of whom was named Raja Ibrahim, and the younger Raja Lella, and were brought up in the house of their master. The father being old was recalled from his post; but on account of his faithful services, the sultan gave the succession to his eldest son, who appears to have been a youth of an ambitious and very sanguinary temper. A jealousy had taken place between him and the chief of Daya, whilst they were together at Pidir, and as soon as he came into power he resolved to seek revenge, and with that view entered in a hostile manner the district of his rival. When the sultan interposed, it not only added fuel to his resentment, but inspired him with hatred towards his master, and he shewed his disrespect by refusing to deliver up, on the requisition of the sultan, certain Portuguese prisoners taken from a vessel lost at Pulo Gomez, and which he afterwards complied with, at the intercession of the Shabandar of Pasë. This conduct manifesting an intention of entirely throwing off his allegiance, his father endeavoured to recal him to a sense of his duty, by representing the obligations in which the family were indebted to the sultan, and the relationship which so nearly connected them. But so far was this admonition from producing any good effect, that he took offence at his father's presumption, and ordered him to be confined in a cage, where he died. Irritated by these acts, the sultan resolved to proceed to extremities against him; but by means of the plunder of some Portuguese vessels, as before related, and the recent defeat of Brito's party, he became so strong in artillery
artillery and ammunition, and so much elated with success, that he set his master at defiance, and prepared to defend himself. His force proved superior to that of Pidir, and in the end he obliged the sultan to fly for refuge and assistance to the European fortress at Pasé, accompanied by his nephew, the chief of Daya, who was also forced from his possessions.

Ibrahim had for some time infested the Portuguese by sending out parties against them, both by sea and land; but these being always baffled in their attempts with much loss, he began to conceive a violent antipathy against that nation, which he ever after indulged to excess. He got possession of the city of Pidir by bribing the principal officers; a mode of warfare that he often found successful, and seldom neglected to attempt. These he prevailed upon to write a letter to their master, couched in artful terms, in which they besought him to come to their assistance with a body of Portuguese, as the only chance of repelling the enemy by whom they pretended to be invested. The sultan shewed this letter to André Henriquez, then governor of the fort, who thinking it a good opportunity to chastise the Achinese, sent by sea a detachment of eighty Europeans and two hundred Malays, under the command of his brother Manuel, whilst the sultan marched over land with a thousand men, and fifteen elephants, to the relief of the place. They arrived at Pidir in the night, but being secretly informed that the king of Achin was master of the city, and that the demand for succour was a stratagem, they endeavoured to make their retreat; which the land troops effected, but before the tide could enable the Portuguese to get their boats afloat, they were attacked by the Achinese, who killed Manuel and thirty-five of his men.

Henriquez perceiving his situation at Pasé was becoming critical, not only from the force of the enemy, but the sickly state of his garrison, and the want of provisions, which the country people now withheld from him, discontinuing the fairs that they were used to keep three times in the week, dispatches advices to the governor of India, demanding immediate succours, and also sent to request assistance of the king of Aru, who had always proved the stedfast friend of Malacca, and who, though

1522.
not wealthy, because his country was not a place of trade, was yet one of the most powerful princes in those parts. The king expressed his joy in having an opportunity of serving his allies, and promised his utmost aid; not only from friendship to them, but indignation against Ibrahim, whom he regarded as a rebellious slave. A supply of stores at length arrived from India, under the charge of Lopo d’Azuedo, who had orders to relieve Henriquez in the command; but disputes having arisen between them, and chiefly on the subject of certain works which the shabandar of Pasé had been permitted to erect adjoining to the fortress, d’Azuedo, to avoid coming to an open rupture, departed for Malacca. Ibrahim having found means to corrupt the honesty of this shabandar, who had received his office from Alboquerque, gained intelligence through him of all that passed. This treason, it is supposed, he would not have yielded to, but for the desperate situation of affairs. The country of Pasé was now entirely in subjection to the Achinese, and nothing remained unconquered but the capital; whilst the garrison was distracted with internal divisions.

After the acquisition of Pidir, the king thought it necessary to remain there some time, in order to confirm his authority, and sent his brother Raja Lella with a large army to reduce the territories of Pasé, which he effected in the course of three months, and with the more facility, because that all the principal nobility had fallen in the action with Jeinal. He fixed his camp within half a league of the city, and gave notice to Ibrahim of the state in which matters were, who speedily joined him, being anxious to render himself master of the place, before the promised succours from the king of Aru could arrive. His first step was to issue a proclamation, giving notice to the people of the town, that whoever should submit to his authority within six days, should have their lives, families, and properties secured to them, but that all others must expect to feel the punishment due to their obstinacy. This had the effect he looked for, the greater part of the inhabitants coming over to his camp. He then commenced his military operations, and in the third attack got possession of the town, after much slaughter; those who escaped his fury taking shelter in the neighbouring mountains and thick
thick woods. He sent a message to the commander of the fortress, requiring him to abandon it, and to deliver into his hands the kings of Pidir and Daya, to whom he had given protection. Henriquez returned a spirited answer to this summons, but being sickly at the time, at best of an unsteady disposition, and too much attached to his trading concerns, for a soldier, he resolved to relinquish the command to his relation Aires Coelho, and take passage for the West of India.

He had not advanced farther on his voyage than the point of Pidir, when he fell in with two Portuguese ships bound to the Moluccas, the captains of which he made acquainted with the situation of the garrison, and they immediately proceeded to its relief. Arriving in the night they heard great firing of cannon, and learned next morning that the Achinese had made a furious assault, in hopes of carrying the fortress, before the ships, which were descried at a distance, could throw succours into it. They had mastered some of the outworks, and the garrison represented that it was impossible for them to support such another shock, without aid from the vessels. The captains with as much force as could be spared, entered the fort, and a sally was shortly afterwards resolved on and executed, in which the besiegers sustained considerable damage. Every effort was likewise employed to repair the breaches, and stop up the mines that had been made by the enemy in order to effect a passage into the place. Ibrahim now attempted to draw them into a snare, by removing his camp to a distance, and making a feint of abandoning his enterprise; but this stratagem proved inefficual. Reflecting then with indignation, that his own force consisted of fifteen thousand men, whilst that of the Europeans did not exceed three hundred and fifty, many of whom were sick and wounded, and others worn out with the fatigue of continual duty, (intelligence whereof was conveyed to him) he resolved once more to return to the siege, and make a general assault upon all parts of the fortification at once. Two hours before day-break he caused the place to be surrounded with eight thousand men, who approached in perfect silence. The night time was preferred by these people for making their attacks, as being then most secure from the effect of fire-arms, and they also generally chose a time of rain, when the powder would not burn. As soon as they found themselves perceived,
perceived, they set up a hideous shout, and fixing their scaling ladders, made of bamboo, and wonderfully light, to the number of six hundred, they attempted to force their way through the embrasures for the guns; but after a strenuous contest they were at length repulsed. Seven ele-phants were driven with violence against the paling of one of the bastions, which gave way before them like a hedge, and overset all the men who were on it. Javelins and pikes these enormous beasts made no account of, but upon setting fire to powder under their trunks, they drew back with precipitation, in spite of all the efforts of their drivers; overthrew their own people; and flying to the distance of several miles, could not again be brought into the lines. The Achinese upon receiving this check, thought to take revenge by setting fire to some vessels that were in the dock yard; but this proved an unfortunate measure to them, for by the light which it occasioned, the garrison were enabled to point their guns, and did abundant execution.

Henriquez, after beating sometime against a contrary wind, put back to Pasė, and coming on shore the day after this conflict, resumed his command. A council was soon after held, to determine what measures were fittest to be pursued in the present situation of affairs, and taking into their consideration that no further assistance could be expected from the west of India in less than six months; that the garrison was sickly, and provisions short, it was resolved, by a majority of votes, to abandon the place, and measures were taken accordingly. In order to conceal their intentions from the enemy, they ordered such of the artillery and stores as could be removed conveniently, to be packed up in the form of merchandise, and then shipped off. A party was left to set fire to the buildings, and trains of powder were so disposed as to lead to the larger cannon, which they over-charged, that they might burst as soon as heated. But this was not effectually executed, and the pieces mostly fell into the hands of the Achinese, who upon the first alarm of the evacuation rushed in, extinguished the flames, and turned upon the Portuguese their own artillery, many of whom were killed in the water, as they hurried to get into their boats. They now lost as much credit by this ill conducted retreat, as they had acquired by their gallant de-fence; and were insulted by the reproachful shouts of the enemy; whose power
power was greatly increased by this acquisition of military stores, and of which they often severely experienced the effects. To render their disgrace more striking, it happened that as they sailed out of the harbour, they met thirty boats laden with provisions for their use from the king of Aru, who was himself on his march over-land with four thousand men: and when they arrived at Malacca they found troops and stores embarked there for their relief. The unfortunate princes who had sought an asylum with them, now joined in their flight; the sultan of Pasé proceeded to Malacca, and the sultan of Pidir and chief of Daya took refuge with the king of Aru.

Raja Nara, king of Indragiri, in conjunction with a force from Bintang, attacked the king of a neighbouring island, called Liṅga, who was in friendship with the Portuguese. A message which passed on this occasion gives a just idea of the style and manners of this people. Upon their acquainting the king of Liṅga, in their summons of surrender, that they had lately overcome the fleet of Malacca, he replied, that his intelligence informed him of the contrary; that he had just made a festival and killed fifty goats to celebrate one defeat which they had received, and hoped soon to kill an hundred, in order to celebrate a second. His expectations were fulfilled, or rather anticipated, for the Portuguese having a knowledge of the king of Indragiri's design, sent out a small fleet, which routed the combined force before the king of Liṅga was acquainted with their arrival; his capital being situated high up on the river. In the next year, at the conquest of Bintang, this king, unsolicited, sent assistance to his European allies.

However well founded the accounts may have been which the Portuguese have given us of the cruelties committed against their people by the king of Achin, the barbarity does not appear to have been only on one side. Francisco de Mello being sent in an armed vessel with dispatches to Goa, met, near Achin-head, with a ship of that nation just arrived from Mecca, and supposed to be richly laden. As she had on board three hundred Achinese and forty Arabs, he dared not venture to board her, but battered her at a distance; when suddenly she filled and sunk, to the extreme disappointment of the Portuguese, who thereby
lost their prize; but they wreaked their vengeance on the unfortunate crew, as they endeavoured to save themselves by swimming, and boast that they did not suffer a man to escape. Opportunities of retaliation soon offered.

Simão de Sousa going with a reinforcement to the Moluccas from Cochin, was overtaken in the bay by a violent storm, which forced him to stow many of his guns in the hold; and having lost several of his men through fatigue, he made for the nearest port he could take shelter in, which proved to be Achin. The king having the destruction of the Portuguese at heart, and resolving, if possible, to seize their vessel, sent off a message to De Sousa, recommending his standing in closer to the shore, where he would have more shelter from the gale which still continued, and lie more conveniently for getting off water and provisions; at the same time inviting him to land. This artifice not succeeding, he ordered out the next morning a thousand men in twenty boats, who at first pretended they were come to assist in mooring the ship; but the captain, aware of their hostile design, fired amongst them; when a fierce engagement took place, in which the Achinese were repulsed with great slaughter, but not until they had destroyed forty of the Portuguese. The king, enraged at this disappointment, ordered a second attack, threatening to have his admiral trampled to death by elephants if he failed of success. A boat was sent a-head of this fleet with a signal of peace, and assurances to De Sousa, that the king, as soon as he was made acquainted with the injury that had been committed, had caused the perpetrators of it to be punished, and now once more requested him to come on shore and trust to his honour. This proposal some of the crew were inclined that he should accept, but, being animated by a speech that he made to them, it was resolved, that they should die with arms in their hands, in preference to a disgraceful and hazardous submission. The combat was therefore renewed, with extreme fury on the one side, and uncommon efforts of courage on the other, and the assailants were a second time repulsed; but one of those who had boarded the vessel and afterwards made his escape, represented to the Achinese the reduced and helpless situation of their enemy, and fresh supplies coming off, they were encouraged to return to the attack. De Sousa and his people were at length almost
almost all cut to pieces, and those who survived, being desperately wounded, were overpowered, and led prisoners to the king, who unexpectedly treated them with extraordinary kindness, in order to cover the designs he harboured, and pretended to lament the fate of their brave commander. He directed them to fix upon one of their companions, who should go in his name to the governor of Malacca, to desire he would immediately send to take possession of the ship, which he meant to restore, as well as to liberate them. He hoped by this artifice to draw more of the Portuguese into his power, and at the same time to effect a purpose of a political nature. A war had recently broke out between him and the king of Aru, the latter of whom had deputed ambassadors to Malacca, to solicit assistance, in return for his former services; and which was readily promised to him. It was highly the interest of the king of Achin to prevent this junction, and therefore, though determined to relax nothing in his plans of revenge, he hastened to dispatch Antonio Caldeira, one of the captives, with proposals of accommodation and alliance, offering to restore not only this vessel, but also the artillery which he had taken at Pasé. These terms appeared to the governor too advantageous to be rejected. Conceiving a favourable idea of the king's intentions, from the confidence which Caldeira, who was deceived by the humanity shewn to the wounded captives, appeared to place in his sincerity, he became deaf to the representations that were made to him by more experienced persons, of his insidious character. A message was sent back, agreeing to accept his friendship on the proposed conditions, and engaging to withhold the promised succours from the king of Aru. Caldeira, in his way to Achin, touched at an island, where he was cut off with those who accompanied him. The ambassadors from Aru being acquainted with this breach of faith, retired in great disgust, and the king, incensed at the ingratitude shewn him, concluded a peace with Achin; but not till after an engagement between their fleets had taken place, in which the victory remained undecided.

In order that he might learn the causes of the obscurity in which his negotiations with Malacca rested, Ibrahim dispatched a secret messenger to Senaia Raja, bandhara of that city, with whom he held a corres-

pondence;
pondence; desiring also to be informed of the strength of the garrison. Hearing in answer, that the governor newly arrived was inclined to think favourably of him, he immediately sent an ambassador to wait on him, with assurances of his pacific and friendly disposition; who returned in company with persons empowered, on the governor’s part, to negotiate a treaty of commerce. These, upon their arrival at Achin, were loaded with favours and costly presents; the news of which quickly flew to Malacca; and the business they came on being adjusted, they were suffered to depart; but they had not sailed far before they were overtaken by boats sent after them, and were stript and murdered. The governor, who had heard of their setting out, concluded they were lost by accident. Intelligence of this mistaken opinion was transmitted to the king, who thereupon had the audacity to request that he might be honoured with the presence of some Portuguese of rank and consequence in his capital, to ratify in a becoming manner the articles that had been drawn up; as he ardently wished to see that nation trafficking freely in his dominions. The deluded governor, in compliance with this request, adopted the resolution of sending thither a large ship, under the command of Manuel Pacheco, with a rich cargo, the property of himself and several merchants of Malacca, who themselves embarked, with the idea of making extraordinary profits. Senaia conveyed notice of this preparation to Achin, informing the king at the same time, that if he could make himself master of this vessel, Malacca must fall an easy prey to him, as the place was weakened of half its force for the equipment. When Pacheco approached the harbour he was surrounded by a great number of boats, and some of the people began to suspect treachery, but so strongly did the spirit of delusion prevail in this business, that they could not persuade the captain to put himself on his guard. He soon had reason to repent his credulity. Perceiving an arrow pass close by him, he hastened to put on his coat of mail, when a second pierced his neck, and he soon expired. The vessel then became an easy prey, and the people being made prisoners, were shortly afterwards massacred by the king’s order, along with the unfortunate remnant of De Sousa’s crew, so long flattered with the hopes of release. By this capture the king was supposed to have remained in possession of more artillery than was left in Malacca, and he immediately fitted out a fleet to take advantage of its exposed
exposed state. The pride of success causing him to imagine it already in his power, he sent a taunting message to the governor, in which he thanked him for the late instances of his liberality, and let him know he should trouble him for the remainder of his naval force.

_Senaia_ had promised to put the citadel into his hands, and this had certainly been executed but for an accident that discovered his treasonable designs. The crews of some vessels of the Achinese fleet landed on a part of the coast not far from the city, where they were well entertained by the natives, and in the openness of conviviality, related the transactions which had lately passed at Achin, the correspondence of _Senaia_, and the scheme that was laid for rising on the Portuguese when they should be at church, murdering them, and seizing the fortress. Intelligence of this was reported with speed to the governor, who had _Senaia_ instantly apprehended and executed. This punishment served to intimidate those among the inhabitants who were engaged in the conspiracy, and disconcerted the plans of the king of Achin.

This appears to be the last transaction of _Ibrahim_'s reign recorded by the Portuguese historians. His death is stated by De Barros to have taken place in the year 1528, in consequence of poison administered to him by one of his wives, to revenge the injuries her brother, the chief of _Daya_, had suffered at his hand. In a Malayan work (lately come into my possession) containing the annals of the kingdom of Achin, it is said that a king, whose title was sultan _Saleh-eddin-shah_, obtained the sovereignty in a year answering to 1511 of our era, and who, after reigning about eighteen years, was dethroned by a brother in 1529. Notwithstanding some apparent discordance between the two accounts, there can be little doubt of the circumstances applying to the same individual, as it may well be presumed that, according to the usual practice in the East, he adopted, upon ascending the throne, a title different from the name which he had originally borne, although that might continue to be his more familiar appellation, especially in the mouths of his enemies. The want of precise coincidence in the dates cannot be thought an objection, as the event not falling under the immediate observation of the Portuguese, they cannot pretend to accuracy within a few
few months, and even their account of the subsequent transactions renders it more probable that it happened in 1529; nor are the facts of his being dethroned by the brother, or put to death by the sister, materially at variance with each other; and the latter circumstance, whether true or false, might naturally enough be reported at Malacca.

His successor took the name of Ala-eddin-shah, and afterwards, from his great enterprises, acquired the additional epithet of keher or the powerful. By the Portuguese he is said to have styled himself king of Achin, Barus, Pidir, Pase, Daya, and Batta, prince of the land of the two seas, and of the mines of Menangkabau. Nothing is recorded of his reign until the year 1537, in which he twice attacked Malacca. The first time he sent an army of three thousand men, who landed near the city by night, unperceived by the garrison, and having committed some ravages in the suburbs, were advancing to the bridge, when the governor, Estavano de Gama, sallied out with a party, and obliged them to retreat for shelter to the woods. Here they defended themselves during the next day, but on the following night they re-embarked, with the loss of five hundred men. A few months afterwards the king had the place invested with a larger force; but in the interval the works had been repaired and strengthened, and after three days ineffectual attempt the Achinese were again constrained to retire. In the year 1547 he once more fitted out a fleet against Malacca, where a descent was made; but contented with some trifling plunder, the army re-embarked, and the vessels proceeded to the river of Parles on the Malayan coast. Hither they were followed by a Portuguese squadron, which attacked and defeated a division of the fleet, at the mouth of the river. This victory was rendered famous, not so much by the valour of the combatants, as by a revelation opportunely made from heaven to the celebrated missionary Francisco Xavier, of the time and circumstances of it, and which he announced to the garrison, at a moment when the approach of a powerful invader from another quarter, had caused much alarm and apprehension among them.

Many transactions of the reign of this prince, particularly with the neighbouring states of Batta and Aru (about the years 1539 and 1541) are
are mentioned by Ferdinand Mendez Pinto; but his writings are too apocryphal to allow of the facts being recorded upon his authority. Yet there is the strongest internal evidence of his having been more intimately acquainted with the countries of which we are now speaking, the character of the inhabitants, and the political transactions of the period, than any of his cotemporaries; and it appears highly probable, that what he has related is substantially true: but there is also reason to believe, that he composed his work from recollection, after his return to Europe, and he may not have been scrupulous in supplying from a fertile imagination the unavoidable failures of a memory, however richly stored.

The death of Ala-eddin took place, according to the Annals, in 1556, after a reign of twenty-eight years. He was succeeded by sultan Hussein-shah, who reigned about eight, and dying in 1565, was succeeded by his son, an infant. This child survived only seven months; and in the same year the throne was occupied by Raja Firman-shah, who was murdered soon after. His successor, Raja Janil, experienced a similar fate, when he had reigned ten months. This event is placed in 1567. Sultan Mansur-shah, from the kingdom of Perak in the peninsula, was the next who ascended the throne.

The western powers of India having formed a league for the purpose of extirpating the Portuguese, the king of Achin was invited to accede to it, and in conformity with the engagements by which the respective parties were bound, he prepared to attack them in Malacca, and carried thither a numerous fleet, in which were fifteen thousand people of his own subjects, and four hundred Turks, with two hundred pieces of artillery of different sizes. In order to amuse the enemy, he gave out that his force was destined against Java, and sent a letter, accompanied with a present of a kris, to the governor, professing strong sentiments of friendship. A person whom he turned on shore with marks of ignominy, being suspected for a spy, was taken up, and being put to the torture, confessed that he was employed by the Ottoman emperor and king of Achin, to poison the principal officers of the place, and to set fire
fire to their magazine. He was put to death, and his mutilated carcase was sent off to the king. This was the signal for hostilities. He immediately landed with all his men, and commenced a regular siege. Sallies were made with various success, and very unequal numbers. In one of these, the chief of Aru, the king’s eldest son, was killed. In another the Portuguese were defeated and lost many officers. A variety of stratagems were employed to work upon the fears, and shake the fidelity of the inhabitants of the town. A general assault was given, in which, after prodigious efforts of courage, and imminent risk of destruction, the besieged remained victorious. The king seeing all his attempts fruitless, at length departed, having lost three thousand men before the walls, beside about five hundred who were said to have died of their wounds on the passage. The king of Ujong-tanah or Johor, who arrived with a fleet to the assistance of the place, found the sea for a long distance covered with dead bodies. This was esteemed one of the most desperate and honourable sieges the Portuguese experienced in India, their whole force consisting of but fifteen hundred men, of whom no more than two hundred were Europeans.

In the following year a vessel from Achin bound to Java, with ambassadors on board to the queen of Japara, in whom the king wished to raise up a new enemy against the Portuguese, was met in the straits by a vessel from Malacca, who took her, and put all the people to the sword. It appears to have been a maxim in these wars, never to give quarter to an enemy, whether resisting or submitting. In 1569 a single ship, commanded by Lopez Carrasco, passing near Achin, fell in with a fleet coming out of that port, consisting of twenty large galleys, and an hundred and eighty other vessels, commanded by the king in person, and supposed to be designed against Malacca. The situation of the Portuguese was desperate. They could not expect to escape, and therefore resolved to die like men. During three days they sustained a continual attack, when, after having by incredible exertions destroyed forty of the enemy’s vessels, and being themselves reduced to the state of a wreck, a second ship appeared in sight. The king perceiving this, retired into the harbour with his shattered forces.
It is difficult to determine which of the two is the more astonishing; the vigorous stand made by such a handful of men as the whole strength of Malacca consisted of; or the prodigious resources and perseverance of the Achinese monarch. In 1573, after forming an alliance with the queen of Japara, the object of which was the destruction of the European power, he appeared again before Malacca with ninety vessels, twenty-five of them large gallies, with seven thousand men, and great store of artillery. He began his operations by sending a party to set fire to the suburbs of the town, but a timely shower of rain prevented its taking effect. He then resolved on a different mode of warfare, and tried to starve the place to a surrender, by blocking up the harbour, and cutting off all supplies of provisions. The Portuguese to prevent the fatal consequences of this measure, collected those few vessels which they were masters of, and a merchant ship of some force arriving opportunely, they put to sea, attacked the enemies fleet, killed the principal captain, and obtained a complete victory. In the year following, Malacca was invested by an armada from the queen of Japara, of three hundred sail, eighty of which were junks of four hundred tons burthen. After besieging the place for three months, till the very air became corrupted by their stay, the fleet retired with little more than five thousand men, of fifteen that embarked on the expedition.

Scarcely was the Javanese force departed, when the king of Achin once more appeared with a fleet that is described as covering the straits. He ordered an attack upon three Portuguese frigates that were in the road protecting some provision vessels; which was excuted with such a furious discharge of artillery, that they were presently destroyed with all their crews. This was a dreadful blow to Malacca, and lamented, as the historian relates, with tears of blood by the little garrison, who were not now above an hundred and fifty men, and of those a great part non-effective. The king, elated with his success, landed his troops, and laid siege to the fort, which he battered at intervals during seventeen days. The fire of the Portuguese became very slack, and after some time totally ceased, as the governor judged it prudent to reserve his small stock of ammunition for an effort at the last extremity. The king, alarmed at this
this silence, which he construed into a preparation for some dangerous stratagem, was seized with a panic, and suddenly raising the siege, embarked with the utmost precipitation; unexpectedly relieving the garrison from the ruin that hung over it, and which seemed inevitable in the ordinary course of events.

In 1582 we find the king appearing again before Malacca with an hundred and fifty sail of vessels. After some skirmishes with the Portuguese ships, in which the success was nearly equal on both sides, the Achinese proceeded to attack Johor, the king of which was then in alliance with Malacca. Twelve ships followed them thither, and having burned some of their galleys, defeated the rest, and obliged them to fly to Achin. The operations of these campaigns, and particularly the valour of the commander, named Raja Makuta, are alluded to in Queen Elizabeth's letter to the king, delivered in 1602 by Sir James Lancaster.

About three or four years after this misfortune Mansur-shah prepared a fleet of no less than three hundred sail of vessels, and was ready to embark once more upon his favourite enterprise, when he was murdered, together with his queen and many of the principal nobility, by the general of the forces, who had long formed designs upon the crown. This was perpetrated in May, 1585, when he had reigned nearly eighteen years. In his time the consequence of the kingdom of Achin is represented to have arrived at a considerable height, and its friendship to have been courted by the most powerful states. No city in India possessed a more flourishing trade, the port being crowded with merchant vessels, which were encouraged to resort thither by the moderate rates of the customs levied; and although the Portuguese and their ships were continually plundered, those belonging to every Asiatic power, from Mecca in the West to Japan in the East, appear to have enjoyed protection and security. The despotic authority of the monarch was counterpoised by the influence of the orang-kayas or nobility, who are described as being possessed of great wealth, living in fortified houses, surrounded by numerous dependants, and feeling themselves above control, often giving a licentious range to their proud and impatient tempers.

The
SUMATRA.

The late monarch's daughter and only child was married to the king of Johor, by whom she had a son, who being regarded as heir to the crown of Achin, had been brought to the latter place to be educated under the eye of his grandfather. When the general (whose name is corruptly written Moratiza) assumed the powers of government, he declared himself the protector of this child, and we find him mentioned in the Annals by the title of Sultan Buyong (or the Boy), but before he had completed the third year of his nominal reign, he also was dispatched, and the usurper took formal possession of the throne in the year 1588, by the name of Ala-eddin Rayet-shah, being then at an advanced period of life.

The Annals say he was the grandson of Sultan Firman-shah; but the Europeans who visited Achin during his reign report him to have been originally a fisherman, who, having afterwards served in the wars against Malacca, shewed so much courage, prudence, and skill in maritime affairs, that the late king made him at length the chief commander of his forces, and gave him one of his nearest kinswomen to wife, in right of whom he is said to have laid claim to the throne.

The French Commodore Beaulieu relates the circumstances of this revolution in a very different manner. He says, that upon the extinction

3 K

The king of Acheen sent on this occasion, to Johor, a piece of ordnance, such as for greatness, length, and workmanship (says Linschoten), could hardly be matched in all Christendom. It was afterwards taken by the Portuguese, who shipped it for Europe, but the vessel was lost in her passage.

Valentyn, by an obvious corruption, names him Sulthan Alciden Ryetza, and this coincidence is strongly in favour of the authenticity and correctness of the Annals. John Davis, who will be hereafter mentioned, calls him, with sufficient accuracy, Sultan Aladin.

The commodore had great opportunity of information, was a man of very superior ability, and indefatigable in his inquiries upon all subjects, as appears by the excellent account of his voyage, and of Achin in particular, written by himself, and published in Thevenot's collection, of which there is an English translation in Harris; but it is possible he may, in this instance, have been amused by a plausible tale from the grandson of this monarch,
tion of the ancient royal line, which happened about forty years before the period at which he wrote, the orang-kayas met in order to chuse a king, but every one affecting the dignity for himself, they could not agree, and resolved to decide it by force. In this ferment the cadi or chief judge, by his authority and remonstrances persuaded them to offer the crown to a certain noble, who in all these divisions had taken no part, but had lived in the reputation of a wise, experienced man, being then seventy years of age, and descended from one of the most respectable families of the country. After several excuses on his side, and entreaties and even threats on theirs, he at length consented to accept the dignity thus imposed upon him, provided they should regard him as a father, and receive correction from him as his children; but no sooner was he in possession of the sovereign power than (like Pope Sixtus the Fifth) he shewed a different face, and the first step after his accession was to invite the orang-kayas to a feast, where, as they were separately introduced, he caused them to be seized and murdered in a court behind the palace. He then proceeded to demolish their fortified houses, and lodged their cannon, arms, and goods, in the castle, taking measures to prevent in future the erection of any buildings of substantial materials that could afford him grounds of jealousy. He raised his own adherents, from the lower class of people, to the first dignities of the state, and of those who presumed to express any disapprobation of his conduct, he made great slaughter, being supposed to have executed not less than twenty thousand persons in the first year of his reign.

From the silence of the Portuguese writers with respect to the actions of this king, we have reason to conclude, that he did not make any attempts to disturb their settlement of Malacca; and it even appears that some persons in the character of ambassadors or agents from that power resided at Achin, the principal object of whose policy appears to have been monarch, with whom he had much intercourse. John Davis, an intelligent English navigator, whose account I have followed, might have been more likely to hear the truth, as he was at Achin (though not a frequenter of the court) during Ala-eddin's reign, whereas Beau-lieu did not arrive till twenty years after; and the report of his having been originally a fisherman, is also mentioned by the Dutch writers.
been that of inspiring him with jealousy and hatred of the Hollanders, who in their turn were actively exerting themselves to supplant the conquerors of India.

Towards the close of the sixteenth century they began to navigate these seas; and in June, 1600, visited Achin with two ships, but had no cause to boast of the hospitality of their reception. An attempt was made to cut them off, and evidently by the orders or connivance of the king, who had prevailed upon the Dutch admiral to take on board troops and military stores for an expedition meditated, or pretended, against the city of Johor, which these ships were to bombard. Several of the crews were murdered, but after a desperate conflict in both ships, the treacherous assailants were overcome and driven into the water, "and it was some pleasure (says John Davis, an Englishman, who was the principal pilot of the squadron) to see how the base Indians did fly, how they were killed, and how well they were drowned." This barbarous and apparently unprovoked attack was attributed, but perhaps without any just grounds, to the instigation of the Portuguese.

In November, 1600, Paulus van Caarden having also the command of two Dutch ships, was received upon his landing with much ceremony; but at his first audience the king refused to read a letter from the Prince of Orange, upon its being suggested to him that (instead of paper) it was written on the skin of an unclean animal; and the subsequent treatment experienced by this officer was uniformly bad. It appears, however, that in December, 1601, the king was so far reconciled to this new power as to send two ambassadors to Holland, one of whom died there in August, 1602, and the other returned to Achin subsequently to the death of his master.

3 K 2

All the Dutchmen on shore at the time were made prisoners, and many of them continued in that state for several years. Among these was Captain Frederick Houtman, whose Vocabulary of the Malayan language was printed at Amsterdam in 1604, being the first that was published in Europe. My copy has the writer's autograph.
The first English fleet that made its appearance in this part of the world, and laid the foundation of a commerce which was in time to eclipse that of every other European state, arrived at Achin in June, 1602. Sir James Lancaster, who commanded it, was received by the king with abundant ceremony and respect, which seem with these monarchs to have been usually proportioned to the number of vessels and apparent strength of their foreign guests. The queen of England's letter was conveyed to court with great pomp, and the general, after delivering a rich present, the most admired article of which was a fan of feathers, declared the purpose of his coming was to establish peace and amity between his royal mistress, and her loving brother, the great and mighty king of Achin. He was invited to a banquet prepared for his entertainment, in which the service was of gold, and the king's damsels, who were richly attired and adorned with bracelets and jewels, were ordered to divert him with dancing and music. Before he retired he was arrayed by the king in a magnificent habit of the country, and ammonia wit two krises. In the present sent as a return for the queen's, there was, among other matters, a valuable ruby set in a ring. Two of the nobles, one of whom was the chief priest, were appointed to settle with Lancaster the terms of a commercial treaty, which was accordingly drawn up and executed in an explicit and regular manner. The Portuguese ambassador, or more properly the Spanish, as those kingdoms were now united, kept a watchful and jealous eye upon his proceedings; but by bribing the spies who surrounded him, he foiled them at their own arts, and acquired intelligence that enabled him to take a rich prize in the straits of Malacca, with which he returned to Achin; and having loaded what pepper he could procure there, took his departure in November of the same year. On this occasion it was requested by the king, that he and his officers would favour him by singing one of the psalms of David, which was performed with much solemnity.

Very little is known of the military transactions of this reign, and no conquest but that of Pasë is recorded. He had two sons, the younger of whom he made king of Pidir, and the elder, styled Sultan Muda, he kept at Achin, in order to succeed him in the throne. In the year 1603,
1603, he resolved to divide the charge of government with his intended heir, as he found his extraordinary age began to render him unequal to the task, and accordingly invested him with royal dignity; but the effect which might have been foreseen quickly followed this measure. The son, who was already advanced in years, became impatient to enjoy more complete power, and thinking his father had possessed the crown sufficiently long, he confined him in a prison, where his days were soon ended. The exact period at which this event took place is not known, but calculating from the duration of his reign as stated in the Annals, it must have been early in the year 1604. He was then ninety-five years of age, and described to be a hale man, but extremely gross and fat. His constitution must have been uncommonly vigorous, and his muscular strength is indicated by this ludicrous circumstance, that when he once condescended to embrace a Dutch admiral, contrary to the usual manners of his country, the pressure of his arms was so violent as to cause excessive pain to the person so honoured. He was passionately addicted to women, gaming, and drink, his favourite beverage being arrack. By the severity of his punishments he kept his subjects in extreme awe of him; and the merchants were obliged to submit to more exactions and oppressions than were felt under the government of his predecessors. The seizure of certain vessels belonging to the people of Bantam, and other arbitrary proceedings of that nature, are said to have deterred the traders of India from entering into his ports.

The new king, who took the name of Ali Maghayat-shah, proved himself, from indolence or want of capacity, unfit to reign. He was always surrounded by his women, who were not only his attendants but his guards, and carried arms for that purpose. His occupations were the bath and the chase, and the affairs of state were neglected; insomuch that murders, robberies, oppression, and an infinity of disorders took place in the

---

* The Dutch commander Joris van Spilbergen, took leave of him in April, 1603, and his ambassador to Holland, who returned in December, 1604, found his son on the throne, according to Valentyn. Commodore Beaulieu says he died in 1603.

* According to Beaulieu. Davis says he was about an hundred; and the Dutch voyages mention that his great age prevented his ever appearing out of his palace.
the kingdom for want of a regular and strict administration of justice. A son of the daughter of Ala-eddin had been a favourite of his grandfather, at the time of whose death he was twenty-three years of age, and continued, with his mother, to reside at the court after that event. His uncle, the king of Achin, having given him a rebuke on some occasion, he left his palace abruptly, and fled to the king of Pidir, who received him with affection, and refused to send him back at the desire of the elder brother, or to offer any violence to a young prince whom their father loved. This was the occasion of an inveterate war, which cost the lives of many thousand people. The nephew commanded the forces of Pidir, and for some time maintained the advantage, but these at length, seeing themselves much inferior in numbers to the army of Ali-Maghayat, refused to march, and the king was obliged to give him up, when he was conveyed to Achin, and put in close confinement.

Not long afterwards a Portuguese squadron, under Martin Alfonso, going to the relief of Malacca, then besieged by the Dutch, anchored in Achin road, with the resolution of taking revenge on the king, for receiving these their rivals into his ports, contrary to the stipulations of a treaty that had been entered into between them. The viceroy landed his men, who were opposed by a strong force on the part of the Achinese; but after a stout resistance, they gained the first turf fort with two pieces of cannon, and commenced an attack upon the second, of masonry. In this critical juncture, the young prince sent a message to his uncle, requesting he might be permitted to join the army and expose himself in the ranks; declaring himself more willing to die in battle against the Kafers (so they always affected to call the Portuguese) than to languish like a slave in chains. The fears which operated upon the king's mind, induced him to consent to his release. The prince shewed so much bravery on this occasion, and conducted two or three attacks with such success, that Alfonso was obliged to order a retreat, after wasting two days, and losing three hundred men in this fruitless attempt. The reputation of the prince was raised by this affair to a high pitch amongst the people of Achin. His mother, who was an active, ambitious woman, formed the design of placing him on the throne, and furnished him with large sums of money, to be distributed in
in gratuities amongst the principal *orang cayas*. At the same time he endeavoured to ingratiate himself by his manners, with all classes of people. To the rich he was courteous; to the poor he was affable; and he was the constant companion of those who were in the profession of arms. When the king had reigned between three and four years he died suddenly, and at the hour of his death the prince got access to the castle. He bribed the guards; made liberal promises to the officers; advanced a large sum of money to the governor; and sending for the chief priest, obliged him by threats to crown him. In fine, he managed the revolution so happily, that he was proclaimed king before night, to the great joy of the people, who conceived vast hopes from his liberality, courtesy, and valour. The king of *Pidir* was speedily acquainted with the news of his brother's death, but not of the subsequent transactions, and came the next day to take possession of his inheritance. As he approached the castle with a small retinue, he was seized by orders from the reigning prince, who, forgetting the favours he had received, kept him prisoner for a month, and then sending him into the country, under the pretence of a commodious retreat, had him murdered on the way. Those who put the crown on his head were not better requited; particularly the *Maharaja*, or governor of the castle. In a short time his disappointed subjects found, that instead of being humane, he was cruel; instead of being liberal, he displayed extreme avarice; and instead of being affable, he manifested a temper austere and inexorable.

This king, whom the Annals name *Iskander Muda*, was known to our travellers by the title of sultan *Paduka Sri* (words equivalent to "most gracious") sovereign of Achin and of the countries of *Aru, Dilli, Johor, Pahang, Kedah*, and *Perak*, on the one side, and of *Barus, Pasaman, Tiku, Sileda*, and *Priaman* on the other. Some of these places were conquered by him, and others he inherited. He shewed much friendship to the Hollanders in the early part of his reign; and in the year 1613 gave permission to the English to settle a factory, granting them many indulgences, in consequence of a letter and present from king James the first. He bestowed on Captain Best, who was the bearer of them, the title of *orang kaya putih*, and entertained him with the fighting of elephants, buffaloes,
faloes, rams, and tigers. His answer to king James (a translation of which is to be found in Purchas) is couched in the most friendly terms, and he there styles himself king of all Sumatra. He expressed a strong desire that the king of England should send him one of his countrywomen to wife, and promised to make her eldest son king of all the pepper countries, that so the English might be supplied with that commodity by a monarch of their own nation. But notwithstanding his strong professions of attachment to us, and his natural connexion with the Hollanders, arising from their joint enmity to the Portuguese, it was not many years before he began to oppress both nations, and use his endeavours to ruin their trade. He became jealous of their growing power, and particularly in consequence of intelligence that reached him, concerning the encroachments made by the latter in the island of Java.

The conquest of Aru seems never to have been thoroughly effected by the kings of Achin. Paduka Sri carried his arms thither, and boasted of having obtained some victories. In 1613 he subdued Siak in its neighbourhood. Early in the same year he sent an expedition against the kingdom of Johor (which had always maintained a political connexion with Aru) and reducing the city after a siege of twenty-nine days, plundered it of every thing moveable, and made slaves of the miserable inhabitants. The king fled to the island of Bintang; but his youngest brother and coadjutor was taken prisoner and carried to Achin. The old king of Johor, who had so often engaged the Portuguese, left three sons, the eldest of whom succeeded him by the title of Jâng de per-tuan; the second was made king of Siak, and the third called Raja Boîgsu, reigned jointly with the first. He it was who assisted the Hollanders in the first siege of Malacca, and corresponded with Prince Maurice. The king of Achin was married to their sister; but this did not prevent a long and cruel war between them. A Dutch factory at Johor was involved in the consequences of this war, and several of that nation were among the prisoners.

* This is not an individ u a title or proper name, but signifies the sovereign or reigning monarch. In like manner Raja Boîgsu signifies the king’s youngest brother, as Raja Muda does the heir apparent.
prisoners. In the course of the same year, however, the king of Achin thought proper to establish Raja Bonigsu on the throne of Johor, sending him back for that purpose with great honours, assisting him to rebuild the fort and city, and giving him one of his own sisters in marriage.

In 1615 the king of Achin sailed to the attack of Malacca in a fleet which he had been four years employed in preparing. It consisted of above five hundred sail, of which an hundred were large gallies, greater than any at that time built in Europe, carrying each from six to eight hundred men, with three large cannon, and several smaller pieces. These gallies the orang kayas were obliged to furnish, repair, and man, at the peril of their lives. The soldiers served without pay, and carried three months provision at their own charge. In this great fleet there were computed to be sixty thousand men, whom the king commanded in person. His wives and household were taken to sea with him. Coming in sight of the Portuguese ships in the afternoon, they received many shot from them, but avoided returning any, as if from contempt. The next day they got ready for battle, and drew up in form of a half moon. A desperate engagement took place, and lasted without intermission till midnight, during which the Portuguese admiral was three times boarded, and repeatedly on fire. Many vessels on both sides were also in flames, and afforded light to continue the combat. At length the Achinese gave way, after losing fifty sail of different sizes, and twenty thousand men. They retired to Bancalis, on the eastern coast of Sumatra, and shortly afterwards sailed for Achin, the Portuguese not daring to pursue their victory, both on account of the damage they had sustained, and their apprehension of the Hollanders, who were expected at Malacca. The king proposed that the prisoners taken should be mutually given up, which was agreed to, and was the first instance of that act of humanity and civilisation between the two powers.

Three years afterwards the king made a conquest of the cities of Kedah and Perak, on the Malayan coast, and also of a place called Dilli in Sumatra. This last had been strongly fortified by the assistance of the Portuguese, and gave an opportunity of displaying much skill in the attack. Trenches were regularly opened before it, and a siege carried
on for six weeks, ere it fell. In the same year the king of Jorcan (a place unknown at present by that name) fled for refuge to Malacca, with eighty sail of boats, having been expelled his dominions by the king of Achin. The Portuguese were not in a condition to afford him relief, being themselves surrounded with enemies, and fearful of an attack from the Achinese more especially; but the king was then making preparations against an invasion he heard was meditated by the viceroy of Goa. Reciprocal apprehensions kept each party on the defensive.

The French being desirous of participating in the commerce of Achin, of which all the European nations had formed great ideas, and all found themselves disappointed in, sent out a squadron commanded by General Beaulieu, which arrived in January, 1621, and finally left it in December of the same year. He brought magnificent presents to the king, but these did not content his insatiable avarice, and he employed a variety of mean arts to draw from him further gifts. Beaulieu met also with many difficulties, and was forced to submit to much extortion, in his endeavours to procure a loading of pepper, of which Achin itself, as has been observed, produced but little. The king informed him that he had some time since ordered all the plants to be destroyed, not only because the cultivation of them proved an injury to more useful agriculture, but also least their produce might tempt the Europeans to serve him, as they had served the kings of Jakatra and Bantam. From this apprehension, he had lately been induced to expel the English and Dutch from their settlements at Priaman and Tiku, where the principal quantity of pepper was procured, and of which places he changed the governor every third year, to prevent any connexions dangerous to his authority, from being formed. He had likewise driven the Dutch from a factory they were attempting to settle at Padang; which place appears to be the most remote on the western coast of the island, to which the Achinese conquests at any time extended.

Still retaining a strong desire to possess himself of Malacca, so many years the grand object of Achinese ambition, he imprisoned the ambassador then at his court, and made extraordinary preparations for the siege, which he designed
designed to undertake in person. The *laksamana* or commander in chief (who had effected all the king’s late conquests) attempted to oppose this resolution; but the *maharaja*, willing to flatter his master’s propensity, undertook to put him in possession of the city, and had the command of the fleet given to him, as the other had of the land forces. The king set out on the expedition with a fleet of two hundred and fifty sail, (forty-seven of them not less than an hundred feet in the keel) in which were twenty thousand men well appointed, and a great train of artillery. After being some time on board, with his family and retinue as usual, he determined, on account of an ill omen that was observed, to return to the shore. The generals, proceeding without him, soon arrived before Malacca. Having landed their men, they made a judicious disposition, and began the attack with much courage and military skill. The Portuguese were obliged to abandon several of their posts, one of which, after a defence of fifty days, was levelled with the ground, and from its ruins strong works were raised by the *laksamana*. The *maharaja* had seized another post advantageously situated. From their several camps they had lines of communication, and the boats on the river were stationed in such a manner, that the place was completely invested. Matters were in this posture, when a force of two thousand men came to the assistance of the besieged, from the king of *Pahang*, and likewise five sail of Portuguese vessels from the coast of Coromandel; but all was insufficient to remove so powerful an enemy, although by that time they had lost four thousand of their troops in the different attacks and skirmishes. In the latter end of the year a fleet of thirty sail of ships, large and small, under the command of Nunno Alvarez Botello, having on board nine hundred European soldiers, appeared off Malacca, and blocked up the fleet of Achin in a river about three miles from the town. This entirely altered the complexion of affairs. The besiegers retired from their advanced works, and hastened to the defence of their gallies; erecting batteries by the side of the river. The *maharaja* being summoned to surrender, returned a civil, but resolute answer. In the night, endeavouring to make his escape with the smaller vessels, through the midst of the Portuguese, he was repulsed and wounded. Next day the whole force of the Achinese dropped down the stream, with a design to fight their way, but after an engagement of two hours, their principal galley, named
named the "Terour of the world" was boarded and taken, after losing five hundred men of seven which she carried. Many other vessels were afterwards captured or sunk. The laksamana hung out a white flag, and sent to treat with Nunno, but some difficulty arising about the terms, the engagement was renewed with great warmth. News was brought to the Portuguese that the maharaja was killed, and that the king of Pahang was approaching with an hundred sail of vessels to reinforce them. Still the Achinese kept up a dreadful fire, which seemed to render the final success doubtful; but at length they sent proposals, desiring only to be allowed three gallies of all their fleet to carry away four thousand men who remained of twenty that came before the town. It was answered, that they must surrender at discretion; which the laksamana hesitating to do, a furious assault took place both by water and land upon his gallies and works, which were all effectually destroyed or captured; not a ship, and scarcely a man escaping. He himself in the last extremity fled to the woods, but was seized ere long by the king of Pahang's scouts. Being brought before the governor, he said to him, with an undaunted countenance, "Behold here the laksamana for the first time overcome!" He was treated with respect, but kept a prisoner, and sent on his own famous ship, to Goa, in order to be from thence conveyed to Portugal; but death deprived his enemies of that distinguished ornament of their triumph.

This signal defeat proved so important a blow to the power of Achin, that we read of no further attempts to renew the war, until the year 1635, when the king, encouraged by the feuds which at this time prevailed in Malacca, again violated the law of nations, to him little known, by imprisoning their ambassador, and caused all the Portuguese about his court to be murdered. No military operations, however, immediately took place, in consequence of this barbarous proceeding. In the year 1640, the Dutch, with twelve men of war, and the king of Achin with twenty-five gallies, appeared before that harassed and devoted city; which at length, in the following year, was wrested from the hands of the Portuguese, who had so long, through such difficulties, maintained possession of it. This year was also marked by the death of the sultan, whom the Dutch writers name Paduka Sri, at the age of sixty, after a reign of
of thirty-five years; having just lived to see his hereditary foe subdued; and as if the opposition of the Portuguese power, which seems first to have occasioned the rise of that of Achin, was also necessary to its existence, the splendour and consequence of the kingdom from that period, rapidly declined.

The prodigious wealth and resources of the monarchy during his reign, are best evinced by the expeditions he was enabled to fit out; but being no less covetous than ambitious, he contrived to make the expences fall upon his subjects, and at the same time filled his treasury with gold, by press ing the merchants, and plundering the neighbouring states. An intelligent person (Gen. Beaulieu) who was for some time at his court, and had opportunities of information on the subject, uses this strong expression—that he was infinitely rich. He constantly employed in his castle three hundred goldsmiths. This would seem an exaggeration, but that it is well known the Malayan princes have them always about them in great numbers, at this day, working in the manufacture of filagree, for which the country is so famous. His naval strength has been already sufficiently described. He was possessed of two thousand brass guns, and small arms in proportion. His trained elephants amounted to some hundreds. His armies were probably raised only upon the occasion which called for their acting, and that in a mode similar to what was established under the feudal system in Europe. The valley of Achin alone was said to be able to furnish forty thousand men upon an emergency. A certain number of warriors, however, were always kept on foot, for the protection of the king and his capital. Of these the superior class were called ulubalang, and the inferior amba-raja, who were entirely devoted to his service, and resembled the janizaries of Constantinople. Two hundred horsemen nightly patrolled the grounds about the castle, the inner courts and apartments of which were guarded by three thousand women. The king's eunuchs amounted to five hundred.

The disposition of this monarch was cruel and sanguinary. A multitude of instances are recorded of the horrible barbarity of his punishments,
ments, and for the most trivial offences. He imprisoned his own mother, and put her to the torture, suspecting her to have been engaged in a conspiracy against him, with some of the principal nobles, whom he caused to be executed. He murdered his nephew, the king of Johor's son, of whose favour with his mother he was jealous. He also put to death a son of the king of Bantam, and another of the king of Pahang, who were both his near relations. None of the royal family survived in 1622 but his own son, a youth of eighteen, who had been thrice banished the court, and was thought to owe his continuance in life, only to his surpassing his father, if possible, in cruelty, and being hated by all ranks of people. He was at one time made king of Pidir, but recalled on account of his excesses, confined in prison, and put to strange tortures by his father, whom he did not outlive. The whole territory of Achin was almost depopulated by wars, executions, and oppression. The king endeavoured to re-peoplen the country by his conquests. Having ravaged the kingdoms of Johor, Pahang, Kedah, Perak, and Dilli, he transported the inhabitants from those places to Achin, to the number of twenty-two thousand persons. But this barbarous policy did not produce the effect he hoped; for the unhappy people being brought naked to his dominions, and not allowed any kind of maintenance on their arrival, died of hunger in the streets. In the planning his military enterprises, he was generally guided by the distresses of his neighbours, for whom, as for his prey, he unceasingly lay in wait; and his preparatory measures were taken with such secrecy, that the execution alone unravelled them. Insidious political craft, and wanton delight in blood, united in him to complete the character of a tyrant.

It must here be observed, that with respect to the period of this remarkable reign, the European and Malayan authorities are considerably at variance, the latter assigning to it something less than thirty solar years, and placing the death of Iskander Muda in December, 1636. The Annals further state, that he was succeeded by sultan Ala-eddin-Mahayat-shah, who reigned only about four years, and died in February, 1641. That this is the more accurate account I have no hesitation in believing, although Valentyn, who gives a detail of the king's magnificent funeral,
funeral, was persuaded that the reign which ended in 1641, was the same that began in 1607. But he collected his information eighty years after the event, and as it does not appear that any European whose journal has been given to the world, was on the spot at that period, the death of an obscure monarch who died after a short reign, may well have been confounded, by persons at a distance, with that of his more celebrated predecessor. Both authorities, however, are agreed in the important fact, that the successor to the throne, in 1641, was a female. This person is described by Valentyn as being the wife of the old king, and not his daughter, as by some had been asserted; but from the Annals it appears that she was his daughter, named Taju al-alum; and as it was in her right that Maghayat-shah (certainly her husband), obtained the crown, so, upon his decease, there being no male heir, she peaceably succeeded him in the government, and became the first queen regent of Achin. The succession having thenceforward continued nearly sixty years in the female line, this may be regarded as a new era in the history of the country. The nobles finding their power less restrained, and their individual consequence more felt under an administration of this kind, than when ruled by kings (as sometimes they were with a rod of iron) supported these pageants, whom they governed as they thought fit, and thereby virtually changed the constitution into an aristocracy or oligarchy. The business of the state was managed by twelve orang-kayus, four of whom were superior to the rest, and among these the maharaja, or governor of the kingdom, was considered as the chief. It does not appear, nor is it probable, that the queen had the power of appointing or removing any of these great officers. No applications were made to the throne but in their presence, nor any public resolution taken, but as they determined in council. The great object of their political jealousy seems to have been the pretensions of the king of Johor to the crown, in virtue of repeated intermarriages between the royal families of the two countries, and it may be presumed, that the alarms excited from that quarter materially contributed to reconcile them to the female domination. They are accordingly said to have formed an engagement amongst themselves never to pay obedience to a foreign prince, nor to allow their royal mistress to contract any marriage that
might eventually lead to such a consequence.* At the same time, by a new treaty with Johor, its king was indirectly excused from the homage to the crown of Achin which had been insisted upon by her predecessors, and was the occasion of frequent wars.

In proportion as the political consequence of the kingdom declined, its history, as noticed by foreigners, becomes obscure. Little is recorded of the transactions of her reign, and it is likely that Achin took no active part in the concerns of neighbouring powers, but suffered the Hollanders, who maintained in general a friendly intercourse with her, to remain in quiet possession of Malacca. In 1643 they sent an ambassador to compliment her upon her accession, and at the same time to solicit payment for a quantity of valuable jewels ordered by the deceased king, but for the amount of which she declined so make herself responsible. It is said (but the fact will admit of much doubt) that in 1660 she was inclined to marry one of their countrymen, and would have carried her design into execution, had not the East India Company prevented by their authority a connexion that might, as they prudently judged, be productive of embarrassment to their affairs. The Dutch, however, complain that she gave assistance to their enemies the people of Perak, and in 1664 it was found necessary to send a squadron under the command of Pieter de Bitter, to bring her to reason. As it happened that she was at this time at war with some of her own dependants, he made himself master of several places on the western coast, that were nominally at least belonging to Achin. About 1666 the English establishments at Achin and some ports to the southward, appear to have given considerable umbrage to their rivals. In 1669 the people of Dilli on the north-eastern coast threw off their allegiance, and the power of the kingdom became gradually

* However fanciful it may be thought, I cannot doubt that the example of our Queen Elizabeth, whose character and government were highly popular with the Achinese on account of her triumphant contest with the united powers of Spain and Portugal, had a strong influence in the establishment of this new species of monarchy, and that the example of her sister's marriage with Philip may have contributed to the resolution taken by the nobles. The actions of our illustrious queen were a common topic of conversation between the old tyrant and Sir James Lancaster.
dually more and more circumscribed. This queen died in 1675, after reigning, with a degree of tranquillity little known in these countries, upwards of thirty-four years.

The people being now accustomed and reconciled to female rule, which they found more lenient than that of their kings, acquiesced in general in the established mode of government, and she was immediately succeeded by another female monarch, named Nur al-alum, who reigned little more than two years, and died in 1677.

The queen who succeeded her was named Anayet-shah. In the year 1684 she received an embassy from the English government of Madras, and appeared at that time to be about forty years. The persons who were on this occasion presented to her express their suspicions, which were suggested to them by a doubt prevailing amongst the inhabitants, that this sovereign was not a real queen, but an eunuch dressed up in female apparel, and imposed on the public by the artifices of the orang kayas. But as such a cheat, though managed with every semblance of reality (which they observe was the case) could not be carried on for any number of years without detection, and as the same idea does not appear to have been entertained at any other period, it is probable they were mistaken in their surmise. Her person they describe to have been large, and her voice surprisingly strong, but not manly.*

The purport of the embassy was to obtain liberty to erect a fortification in her territory, which she peremptorily refused, being contrary to the

---

* The following curious passage is extracted from the journal of these gentlemen’s proceedings. “We went to give our attendance at the palace this day as customary. Being arrived at the place of audience with the oran gayos, the queen was pleased to order us to come nearer, when her majesty was very inquisitive into the use of our wearing periwigs, and what was the convenience of them; to all which we returned satisfactory answers. After this, her majesty desired of Mr. Ord, if it were no affront to him, that he would take off his periwig, that she might see how he appeared without it; which, according to her majesty’s request, he did. She then told us she had heard of our business, and would give her answer by the oran gayos; and so we retired.” I venture, with submission, to observe, that this anecdote seems to put the question of the sex beyond controversy.
the established rules of the kingdom; adding, that if the governor of Madras would fill her palace with gold, she could not permit him to build with brick, either fort or house. To have a factory of timber and plank, was the utmost indulgence that could be allowed; and on that footing, the return of the English, who had not traded there for many years, should be welcomed with great friendship. The queen herself, the orang kayas represented, was not allowed to fortify, lest some foreign power might avail themselves of it, to enslave the country. In the course of these negotiations it was mentioned, that the agriculture of Achin had suffered considerably of late years, by reason of a general licence given to all the inhabitants to search for gold, in the mountains and rivers which afforded that article; whereas the business had formerly been restricted to certain authorized persons, and the rest obliged to till the ground. The court feared to give a public sanction for the settlement of the English on any part of the southern coast, lest it should embroil them with the other European powers.*

* The design of settling a factory at this period, in the dominions of Achin, was occasioned by the recent loss of our establishment at Bantam, which had been originally fixed by Sir James Lancaster in 1603. The circumstances of this event were as follows. The old sultan had thought proper to share the regal power with his son, in the year 1677, and this measure was attended with the obvious effect, of a jealousy between the parent and child, which soon broke forth into open hostilities. The policy of the Dutch led them to take an active part in favour of the young sultan, who had inclined most to their interests, and now solicited their aid. The English, on the other hand, discouraged what appeared to them an unnatural rebellion, but without interfering, as they said, in any other character than that of mediators, or affording military assistance to either party; and which their extreme weakness, rather than their assertions, renders probable. On the twenty-eighth of March, 1682, the Dutch landed a considerable force from Batavia, and soon terminated the war. They placed the young sultan on the throne, delivering the father into his custody, and obtained from him in return for these favours an exclusive privilege of trade in his territories; which was evidently the sole object they had in view. On the first day of April possession was taken of the English factory by a party of Dutch and country soldiers, and on the twelfth the agent and council were obliged to embark with their property on vessels provided for the purpose, which carried them to Batavia. From thence they proceeded to Surat, on the twenty-second of August in the following year.

In order to retain a share in the pepper-trade, the English turned their thoughts towards Achin, and a deputation, consisting of two gentlemen, of the names of Ord and Cawley,
A few years before these transactions she had invited the king of Siam to renew the ancient connexion between their respective states, and to unite was sent thither in 1694; the success of which is above related. It happened that at this time, certain Rajas or chiefs of the country of Priaman, and other places on the west coast of Sumatra were at Achin also, to solicit aid of that court against the Dutch, who had made war upon, and otherwise molested them. These immediately applied to Mr. Ord, expressing a strong desire that the English should settle in their respective districts, offering ground for a fort, and the exclusive purchase of their pepper. They consented to embark for Madras, where an agreement was formed with them by the governor, in the beginning of the year 1685, on the terms they had proposed. In consequence of this, an expedition was fitted out, with the design of establishing a settlement at Priaman; but a day or two before the ships sailed, an invitation, to the like purport, was received from the chiefs of Bengkulu (since corruptly called Bencoolen); and as it was known that a considerable proportion of the pepper that used to be exported from Bantam, had been collected from the neighbourhood of Bencoolen, (at a place called Silebar), it was judged advisable that Mr. Ord, who was the person entrusted with the management of this business, should first proceed thither; particularly as at that season of the year it was the windward port. He arrived there on the twenty-fifth day of June, 1685, and after taking possession of the country assigned to the English Company, and leaving Mr. Broome in charge of the place, he sailed for the purpose of establishing the other settlements. He stopped first at Indrapura, where he found three Englishmen who were left of a small factory, that had been some time before settled there, by a man of the name of Du Jardin. Here he learned that the Dutch, having obtained a knowledge of the original intention of our fixing at Priaman, had anticipated us therein, and sent a party to occupy the situation. In the mean time it was understood in Europe that this place was the chief of our establishments on the coast, and ships were accordingly consigned thither. The same was supposed at Madras, and troops and stores were sent to reinforce it, which were afterwards landed at Indrapura. A settlement was then formed at Manjuta, and another attempted at Batang-kapas, in 1686; but here the Dutch, assisted by a party amongst the natives, assaulted and drove out our people. Every possible opposition, as it was natural to expect, was given by these our rivals to the success of our factories. They fixed themselves in the neighbourhood of them, and endeavoured to obstruct the country people from carrying pepper to them, or supplying them with provisions either by sea or land. Our interests, however, in the end prevailed, and Bencoolen in particular, to which the other places were rendered subordinate in 1686, began to acquire some degree of vigour and respectability. In 1689 encouragement was given to Chinese colonists to settle there, whose number has been continually increasing from that time. In 1691 the Dutch felt the loss of their influence at Silebar and other of the southern countries, where they attempted to exert authority in the name of the sultan of Bantam, and the produce of these places was delivered to the English. This revolution proceeded from the works with which about this time our factory was strengthened. In 1695 a settlement was
unite in a league against the Dutch, by whose encroachments the commerce of her subjects and the extent of her dominions were much circumscribed.

made at Triunang, and two years after at Kattaun and Sablat. The first, in the year 1700, was removed to Bantal. Various applications were made by the natives in different parts of the island for the establishment of factories, particularly from Ayer-Baṅgis to the northward, Palembang on the eastern side, and the people from the countries south of Tallo, near Manna. A person was sent to survey these last, as far as Pulo Pisang and Kroi, in 1715. In consequence of the inconvenience attending the shipping of goods from Bencoolen river, which is often impracticable from the surfs, a warehouse was built, in 1701, at a place then called the core; which gave the first idea of removing the settlement to the point of land which forms the bay of Bencoolen. The unhealthiness of the old situation was thought to render this an expedient step; and accordingly, about 1714, it was in great measure relinquished, and the foundations of Fort Marlborough were laid on a spot two or three miles distant. Being a high plain it was judged to possess considerable advantages; many of which, however, are counterbalanced by its want of the vicinity of a river, so necessary for the ready and plentiful supply of provisions. Some progress had been made in the erection of this fort, when an accident happened, that had nearly destroyed the Company's views. The natives incensed at ill treatment received from the Europeans, who were then but little versed in the knowledge of their dispositions, or the art of managing them by conciliating methods, rose in a body in the year 1719, and forced the garrison, whose ignorant fears rendered them precipitate, to seek refuge on board their ships. These people began now to feel alarms lest the Dutch, taking advantage of the absence of the English, should attempt an establishment, and soon permitted some persons from the northern factories to resettle the place; and supplies arriving from Madras, things returned to their former course, and the fort was completed. The Company's affairs on this coast remained in tranquility for a number of years. The important settlement of Natal was established in 1752, and that of Tappanuli a short time afterwards; which involved the English in fresh disputes with the Dutch, who set up a claim to the country in which they are situated. In the year 1760 the French, under Comte d'Estaing, destroyed all the English settlements on the coast of Sumatra; but they were soon re-established, and our possession secured by the treaty of Paris in 1763. Fort Marlborough, which had been hitherto a peculiar subordinate of Fort St. George, was now formed into an independent presidency, and was furnished with a charter for erecting a mayor's court, but which has never been enforced. In 1781 a detachment of military from thence embarked upon five East India ships, and took possession of Padang and all other Dutch factories, in consequence of the war with that nation. In 1782 the magazine of Fort Marlborough, in which were four hundred barrels of powder, was fired by lightning, and blew up; but providentially few lives were lost. In 1803 an act of parliament was passed "to authorize the East India Company to make their settlement at Fort Marlborough in the East Indies, a factory subordinate to the presidency of Fort William in Bengal, and to transfer the servants who on the reduction of that establishment shall be supernumerary, to the presidency of Fort St. George." In 1798, plants of the nutmeg and clove had, for the
SUMATRA.

cumscribed. It does not appear, however, that this overture was attended with any effect, nor have the limits of the Achinese jurisdiction since that period extended beyond Pidir on the northern, and Barus on the western coast. She died in 1688, having reigned something less than eleven years, and was succeeded by a young queen named Kamalat-shah; but this did not take place without a strong opposition from a faction amongst the orang kayas which wanted to set up a king, and a civil war actually commenced. The two parties drew up their forces on opposite sides of the river, and for two or three nights continued to fire at each other, but in the day time followed their ordinary occupations. These opportunities of intercourse made them sensible of their mutual folly. They agreed to throw aside their arms; and the crown remained in possession of the newly elected queen. It was said to have been esteemed essential, that she should be a maiden, advanced in years, and connected by blood with the ancient royal line. In this reign, an English factory, which had been long discontinued, was re-established at Achin; but in the interval some private traders of this nation had always resided on the spot. These usually endeavoured to persuade the state, that they represented the India Company, and sometimes acquired great influence, which they are accused of having employed in a manner not only detrimental to that body, but to the interests of the merchants of India in general, by monopolizing the trade of the port, throwing impediments in the way of all shipping not consigned to their management, and embezzling the cargoes of such as were. An asylum was also afforded, beyond the reach of law, for all persons whose crimes or debts induced them to fly from the several European settlements. These considerations chiefly made the Company resolve to reclaim their ancient privileges in that kingdom, and a deputation was sent from the presidency of Madras, in the year 1695, for that purpose, with letters addressed to her illustrious majesty the queen of Achin, desiring permission to settle, on the terms her predecessors had granted to them; which was readily complied with, first time, been procured from the Moluccas; and in 1803 a large importation of these valuable articles of cultivation took place. As the plantations were, by the last accounts from thence, in the most flourishing state, very important commercial advantages were expected to be derived from the culture.
with, and a factory, but on a very limited scale, was established accordingly, but soon declined and disappeared. In 1704, when Charles Lockyer (whose account of his voyage, containing a particular description of this place, was published in 1711) visited Achin, one of these independent factors, named Francis Delton, carried on a flourishing trade. In 1695 the Achinese were alarmed by the arrival of six sail of Dutch ships of force, with a number of troops on board, in their road; not having been visited by any of that nation for fifteen years; but they departed without offering any molestation.

This queen was deposed by her subjects (whose grounds of complaint are not stated) about the latter part of the year 1699, after reigning also eleven years; and with her terminated the female dynasty, which, during its continuance of about fifty-nine years, had attracted much notice in Europe.

Her successor was named Beder al-alum sherif Hasham, the nature of whose pretensions to the crown does not positively appear, but there is reason to believe that he was her brother. When he had reigned a little more than two years, it pleased God (as the Annals express it) to afflict him with a distemper which caused his feet and hands to contract (probably the gout) and disqualified him for the performance of his religious duties. Under these circumstances he was induced to resign the government in 1702, and died about a month after his abdication.

Perkasa-alum, a priest, found means, by his intrigues, to acquire the sovereignty, and one of his first acts was to attempt imposing certain duties on the merchandise imported by English traders, who had been indulged with an exemption from all port-charges, excepting the established complimentary presents upon their arrival and receiving the chap or licence. This had been stipulated in the treaty made by Sir James Lancaster, and renewed by Mr. Grey when chief of the Company’s factory. The innovation excited an alarm and determined opposition on the part of the masters of ships then at the place, and they proceeded (under the conduct of Capt. Alexander Hamilton, who published an account of his voyage in 1727) to the very unwarrantable step of commencing hostilities,
hostilities, by firing upon the villages situated near the mouth of the river, and cutting off from the city all supplies of provisions by sea. The inhabitants feeling severely the effects of these violent measures, grew clamorous against the government, which was soon obliged to restore to these insolent traders the privileges for which they contended. Advantage was taken of the public discontents to raise an insurrection in favour of the nephew of the late queen, or, according to the Annals, the son of Beder al-alum (who was probably her brother), in the event of which Perkasa-alum was deposed about the commencement of the year 1704, and after an interregnum or anarchy of three months continuance, the young prince obtained possession of the throne, by the name of Jemal al-alum. From this period the native writers furnish very ample details of the transactions of the Achinese government, as well as of the general state of the country, whose prosperous circumstances during the early part of this king’s reign, are strongly contrasted with the misery and insignificance to which it was reduced by subsequent events. The causes and progress of this political decline cannot be more satisfactorily set forth than in a faithful translation of the Malayan narrative which was drawn up, or extracted from a larger work, for my use, and is distinct from the Annals already mentioned.

"When raja Jemal al-alum reigned in Achin, the country was exceedingly populous, the nobles had large possessions, the merchants were numerous and opulent, the judgments of the king were just, and no man could experience the severity of punishment but through his own fault. In those days the king could not trade on his own account, the nobles having combined to prevent it; but the accustomed duties of the port were considered as his revenue, and ten per cent. was levied for this purpose upon all merchandise coming into the country. The city was then of great extent, the houses were of brick and stone. The most considerable merchant was a man named Daniel, a Hollander; but many of different nations were also settled there, some from Surat, some from Kutch, others from China. When ships arrived in the port, if the merchants could not take off all the cargoes, the king advanced the funds for purchasing what remained, and divided the goods among them, taking no profit to himself. After the departure of the vessel, the king was paid in gold the amount of his principal, without interest.

"His
"His daily amusements were in the grounds allotted for the royal sports. He was attended by an hundred young men, who were obliged to be constantly near his person, day and night, and who were clothed in a sumptuous manner at a monthly expense of an hundred dollars for each man. The government of the different parts of the country was divided, under his authority, amongst the nobles. When a district appeared to be disturbed, he took measures for quelling the insurrection; those who resisted his orders he caused to be apprehended; when the roads were bad, he gave directions for their repair. Such was his conduct in the government. His subjects all feared him, and none dared to condemn his actions. At that time the country was in peace.

"When he had been a few years on the throne, a country lying to the eastward, named Bat uBara, attempted to throw off its subjection to Achin. The chiefs were ordered to repair to court, to answer for their conduct, but they refused to obey. These proceedings raised the king's indignation. He assembled the nobles, and required of them that each should furnish a vessel of war, to be employed on an expedition against that place, and within two months, thirty large gallys, without counting vessels of a smaller size, were built and equipped for sea. When the fleet arrived off Batu Bara (by which must be understood the Malayan district at the mouth of the river, and not the Batu territory through which it takes its course), a letter was sent on shore addressed to the refractory chiefs, summoning them to give proof of their allegiance by appearing in the king's presence, or threatening the alternative of an immediate attack. After much division in their councils, it was at length agreed to feign submission, and a deputation was sent off to the royal fleet, carrying presents of fruit and provisions of all kinds. One of the chiefs carried, as his complimentary offering, some fresh coconuts, of the delicate species called kalapa-gading, into which a drug had been secretly introduced. The king observing these, directed that one should be cut open for him, and having drunk of the juice, became affected with a giddiness in his head. (This symptom shews the poison to have been the upas, but too much diluted in the liquor of the nut, to produce death). Being inclined to repose, the strangers were ordered to return on shore, and finding his indisposition augment, he gave directions for
being conveyed back to Achin, whither his ship sailed next day. The remainder of the fleet continued off the coast during five or six days longer, and then returned likewise without effecting the reduction of the place, which the chiefs had lost no time in fortifying.

"About two years after this transaction, the king, under pretence of amusement, made an excursion to the country lying near the source of the river Achin, then under the jurisdiction of a panglima or governor, named Muda Seti; for it must be understood that this part of the kingdom is divided into three districts, known by the appellations of the Twenty-two, Twenty-six, and Twenty-five Mukims (see p.403), which were governed respectively by Muda Seti, Imam Muda, and Perbawang-Shah (or Purba-wangsa). These three chiefs had the entire control of the country, and when their views were united, they had the power of deposing and setting up kings. Such was the nature of the government. The king’s expedition was undertaken with the design of making himself master of the person of Muda Seti, who had given him umbrage, and on this occasion his followers, of all ranks, were so numerous, that wherever they halted for the night, the fruits of the earth were all devoured, as well as great multitudes of cattle. Muda Seti, however, being aware of the designs against him, had withdrawn himself from the place of his usual residence, and was not to be found when the king arrived there; but a report being brought that he had collected five or six hundred followers and was preparing to make resistance, orders were immediately given for burning his house. This being effected, the king returned immediately to Achin, leaving the forces that had accompanied him at a place called Pakan Badar, distant about half a day’s journey from the capital, where they were directed to entrench themselves. From this post they were driven by the country chief, who advanced rapidly upon them with several thousand men, and forced them to fall back to Padang Siring, where the king was collecting an army, and where a battle was fought soon after, that terminated in the defeat of the royal party with great slaughter. Those who escaped took refuge in the castle along with the king.
"Under these disastrous circumstances he called upon the chiefs who adhered to him to advise what was best to be done, surrounded as they were by the country-people, on whom he invoked the curse of God; when one of them, named Paṅglima Maharaja, gave it as his opinion, that the only effectual measure by which the country could be saved from ruin, would be the king’s withdrawing himself from the capital so long as the enemy should continue in its vicinity, appointing a regent from among the nobles, to govern the country in his absence; and when subordination should be restored, he might then return and take again possession of his throne. To this proposition he signified his assent, on the condition that Paṅglima Maharaja should assure him by an oath that no treachery was intended; which oath was accordingly taken, and the king having nominated as his substitute Maharaja Lela, one of the least considerable of the ulubalangs, retired, with his wives and children, to the country of the Four mukims, situated about three hours journey to the westward of the city. (The Annals say he fled to Pidir in November, 1723.) Great ravages was committed by the insurgents, but they did not attack the palace, and after some days of popular confusion, the chiefs of the Three districts, who (says the writer) must not be confounded with the officers about the person of the king, held a consultation amongst themselves, and exercising an authority of which there had been frequent examples, set up Paṅglima Maharaja in the room of the abdicated king, (by the title, say the Annals, of Juhar al-alum, in December, 1723.) About seven days after his elevation he was seized with a convulsive disorder in his neck and died. A nephew of Jemal al-alum, named Undei Tebang, was then placed upon the throne, but notwithstanding his having bribed the chiefs of the Three districts with thirty katties of gold, they permitted him to enjoy his dignity only a few days, and then deposed him. (The same authority states, that he was set up by the chiefs of the Four mukims, and removed through the influence of Muda Seti.)

"The person whom they next combined to raise to the throne was Maharaja Lela (before-mentioned as the king’s substitute.) It was his good fortune to govern the country in tranquillity for the space of nearly twelve
twelve years, during which period the city of Achin recovered its population. (According to the Annals, he began to reign in February, 1724, by the title of Ala ed-din Ahmed shah Juhan, and died in June, 1735.) It happened that the same day on which the event of his death took place, Jemal al-alum again made his appearance, and advanced to a mosque near the city. His friends advised him to lose no time in possessing himself of the castle, but for trifling reasons that mark the weakness of his character, he resolved to defer the measure till the succeeding day; and the opportunity, as might be expected, was lost. The deceased king left five sons, the eldest of whom, named Po-chat-au (or Po-wak, according to another manuscript) exhorted his brothers to unite with him in the determination of resisting a person whose pretensions were entirely inconsistent with their security. They accordingly sent to demand assistance of Perbawang-shah, chief of the district of the Twenty-five mukims, which lies the nearest to that quarter. He arrived before morning, embraced the five princes, confirmed them in their resolution, and authorised the eldest to assume the government; (which he did, say the Annals, by the title of Ala ed-din Juhan-shah, in September, 1735.) But to this measure the concurrence of the other chiefs was wanting. At day-break the guns of the castle began to play upon the mosque, and some of the shot penetrating its walls, the pusillanimous Jemal al-alum being alarmed at the danger, judged it advisable to retreat from thence, and to set up his standard in another quarter, called kampong Jawa; his people at the same time retaining possession of the mosque. A regular warfare now ensued between the two parties, and continued for no less than ten years (the great chiefs taking different sides); when at length some kind of compromise was effected, that left Po-chat-au (Juhan-shah) in the possession of the throne, which he afterwards enjoyed peaceably for eight years, and no further mention is made of Jemal al-alum. About this period the chiefs took umbrage at his interfering in matters of trade, contrary to what they asserted to be the established custom of the realm, and assembled their forces in order to intimidate him. (The history of Achin presents a continual struggle between the monarch and the aristocracy of the country, which generally made the royal monopoly of trade the ground of crimination and pretext for their rebellions). Panglima Muda Seti being considered as the head of the league, came down
down with twenty thousand followers, and upon the king's refusing to admit into the castle his complimentary present (considering it only as the prelude to humiliating negotiation) another war commenced that lasted for two years, and was at length terminated by Muda Seti's withdrawing from the contest, and returning to his province. About five years after this event, Juhan shah died, and his son, Pochat-bangta, succeeded him, but not (says this writer, who here concludes his abstract) with the general concurrence of the chiefs, and the country long continued in a disturbed state."

The death of Juhan shah is stated in the Annals to have taken place in August, 1760, and the accession of the son, who took the name of Ala ed-din Muhammed shah, not until November of the same year. Other authorities place these events in 1761. Before he had completed the third year of his reign, an insurrection of his subjects obliged him to save himself by flight on board a ship in the road. This happened in 1763 or 1764. The throne was seized by the maharaja (first officer of state) named Sinara, who assumed the title of Beder ed-din Juhan shah, and about the end of 1765, was put to death by the adherents of the fugitive monarch, Muhammed shah, who thereupon returned to the throne. He was exposed, however, to further revolutions. About six years after his restoration, the palace was attacked in the night by a desperate band of two hundred men, headed by a man called Raja Udah, and he was once more obliged to make a precipitate retreat. This usurper took the title of sultan Suliman shah, but after a short reign of three months, was driven out in his turn, and forced to fly for refuge to one of the islands in the eastern sea. The nature of his pretensions, if he had any, have not been stated, but he never gave any further trouble. From this period Muhammed maintained possession of his capital, although it was generally in a state of confusion. "In the year 1772," says Captain Forrest,

* Captain Forrest acquaints us that he visited the court of Mahomed Selim (the latter name is not given to this prince by any other writer) in the year 1764, at which time he appeared to be about forty years of age. It is difficult to reconcile this date with the recorded events of this unfortunate reign, and I have doubts whether it was not the usurper whom the Captain saw.
Forrest, "Mr. Giles Holloway, resident of Tappanooly, was sent to Achin by the Bencoolen government, with a letter and present, to ask leave from the king to make a settlement there. I carried him from his residency. Not being very well on my arrival, I did not accompany Mr. Holloway (a very sensible and discreet gentleman, and who spoke the Malay tongue very fluently) on shore at his first audience; and finding his commission likely to prove abortive, I did not go to the palace at all. There was great anarchy and confusion at this time; and the malecontents came often, as I was informed, near the king's palace at night."

The Captain further remarks, that when again there in 1775, he could not obtain an audience. The Annals report his death to have happened on the 2d of June, 1781, and observe, that from the commencement to the close of his reign the country never enjoyed repose. His brother, named Ala ed-din (or Uleddin, as commonly pronounced, and which seems to have been a favourite title with the Achinese princes), was in exile at Madras during a considerable period, and resided also for some time at Bencoolen.

The eldest son of the deceased king, then about eighteen years of age, succeeded him on the 16th of the same month, by the title of Ala ed-din Mahmud shah Juhan, in spite of an opposition attempted to be raised by the partisans of another son by a favourite wife. Weapons had been drawn in the court before the palace, when the tuanku agung or high-priest, a person of great respectability and influence, by whom the former had been educated, came amidst the crowd, bareheaded, and without attendance, leading his pupil by the hand. Having placed himself between the contending factions, he addressed them to the following effect:—that the prince who stood before them had a natural right and legal claim to the throne of his father; that he had been educated with a view to it, and was qualified to adorn it by his disposition and talents; that he wished, however, to found his pretensions neither upon his birthright nor the strength of the party attached to him, but upon the general voice of his subjects calling him to the sovereignty; that if such was their sentiment, he was ready to undertake the arduous duties of the station, in which, he himself, would assist him with the fruits of his experience; that if, on the contrary, they felt a predilection for his rival,
no blood should be shed on his account, the prince and his tutor being resolved in that case to yield the point without a struggle, and retire to some distant island. This impressive appeal had the desired effect, and the young prince was invited by unanimous acclamation to assume the reins of government. *

Little is known of the transactions of his reign, but that little is in favour of his personal character. The Annals (not always unexceptionable evidence when speaking of the living monarch) describe him as being endowed with every princely virtue, exercising the functions of government with vigour and rectitude, of undaunted courage, attentive to the protection of the ministers of religion, munificent to the descendants of the prophet (seiyid, but commonly pronounced sidi) and to men of learning, prompt at all times to administer justice, and consequently revered

* Mr. Philip Braham, late chief of the East India Company's settlement of Fort Marlborough, by whom the circumstances of this event were related to me, arrived at Achin in July, 1781, about a fortnight after the transaction. He thus described his audience. The king was seated in a gallery (to which there were no visible steps), at the extremity of a spacious hall or court, and a curtain which hung before him was drawn aside when it was his pleasure to appear. In this court were great numbers of female attendants, but not armed, as they have been described. Mr. Braham was introduced through a long file of guards armed with blunderbusses, and then seated on a carpet in front of the gallery. When a conversation had been carried on for some time through the Shahbandar, who communicated his answers to an interpreter, by whom they were reported to the king, the latter perceiving that he spoke the Malay language, addressed him directly, and asked several questions respecting England; what number of wives and children our sovereign had; how many ships of war the English kept in India; what was the French force, and others of that nature. He expressed himself in friendly terms with regard to our nation, and said he should always be happy to countenance our traders in his ports. Even at this early period of his reign he had abolished some vexatious imposts. Mr. Braham had an opportunity of learning the great degree of power and controul possessed by certain of the orang kayus, who held their respective districts in actual sovereignty, and kept the city in awe by stopping, when it suited their purpose, the supplies of provisions. Captain Forrest, who once more visited Achin, in 1784, and was treated with much distinction (see his Voyage to the Mergui Archipelago, p. 51), says, he appeared to be twenty-five years of age; but this was a misconception. Mr. Kenneth Mackenzie, who saw him in 1782, judged him to have been at that time no more than nineteen or twenty, which corresponds with Mr. Braham's statement.
revered and beloved by his people. I have not been enabled to ascertain the year in which he died. It appears by a Malayan letter from Achin, that in 1791 the peace of the capital was much disturbed, and the state of the government, as well as of private property (which induced the writer to reship his goods) precarious. In 1805 his son, then aged twenty-one, was on the throne, and had a contention with his paternal uncle, and at the same time his father-in-law, named Tuanku Raja, by whom he had been compelled to fly (but only for a short time) to Pidir, the usual asylum of the Achinese monarchs. Their quarrel appears to have been rather of a family than of a political nature, and to have proceeded from the irregular conduct of the queen-mother. The low state of this young king's finances, impoverished by a fruitless struggle to enforce, by means of an expensive marine establishment, his right to an exclusive trade, had induced him to make proposals, for mutual accommodation, to the English government of Pulo Pinang.  

2 Since the foregoing was printed, the following information respecting the manners of the Batto people, obtained by Mr. Charles Holloway from Mr. W. H. Hayes, has reached my hands. "In the month of July 1805, an expedition consisting of Sepoys, Malays, and Battas, was sent from Tapanuli against a chief named Punei Manungum, residing at Negatimbul, about thirty miles inland from Old Tapanuli, in consequence of his having attacked a kampong under the protection of the company, murdered several of the inhabitants, and carried others into captivity. After a siege of three days, terms of accommodation being proposed, a cessation of hostilities took place, when the people of each party having laid aside their arms, intermixed with the utmost confidence, and conversed together as if in a state of perfect amity. The terms, however, not proving satisfactory, each again retired to his arms, and renewed the contest with their former inveteracy. On the second day the place was evacuated, and upon our people entering it, Mr. Hayes found the bodies of one man and two women, whom the enemy had put to death before their departure, (being the last remaining of sixteen prisoners whom they had originally carried off,) and from whose legs large pieces had been cut out, evidently for the purpose of being eaten. During the progress of this expedition a small party had been sent to hold in check the chiefs of Labusukum and Singapollum, (inland of Sibogah) who were confederates of Punei Manungum. These, however, proved stronger than was expected, and making a sally from their kampons, attacked the serjeant's party, and killed a sepoy, whom he was obliged to abandon. Mr. Hayes, on his way from Negatimbul, was ordered to march to the support of the retreating party; but these having taken a different route, he remained ignorant of their loss. The village of Singapollum being immediately carried by storm, and the enemy retreating by one gate, as our people entered at the opposite, the accoutrements of the sepoys, who had been killed the day before, were seen hanging as trophies in the front of the houses, and in the town-hall, Mr. Hayes saw the head entirely scalped, and one of the fingers fixed upon a fork or scower, still warm from the fire. On proceeding to the village of Labusukum, situated little more than two hundred yards from the former, he found a large plantain leaf full of human flesh, mixed with lime-juice and chili pepper, from which he inferred that they had been surprised in the very act of feasting on the sepoys, whose body had been divided between the two kampons. Upon differences being settled with the chiefs, they acknowledged with perfect sang-froid that such had been the case, saying at the same time, "you know it is our custom; why should we conceal it?"
Brief Account of the Islands lying off the Western Coast of Sumatra.

The chain of islands which extends itself in a line nearly parallel to the western coast, at the distance from it of little more than a degree, being immediately connected with the principal subject of this work, and being themselves inhabited by a race or races of people apparently from the same original stock as those of the interior of Sumatra, whose genuineness of character has been preserved to a remarkable degree, (whilst the islands on the eastern side are uniformly peopled with Malays), I have thought it expedient to add such authentic information respecting them as I have been enabled to obtain; and this I feel to be the more necessary from observing, in the maps to which I have had recourse, so much error and confusion in applying the names, that the identity, and even the existence of some of them have been considered as doubtful.

Of these islands the most southern is Engano, which is still but very imperfectly known, all attempts to open a friendly communication with the natives having hitherto proved fruitless; and in truth they have had but too much reason to consider strangers attempting to land on their coast, as piratical enemies. In the voyage of J. J. Saar, published in 1662, we have an account of an expedition fitted out from Batavia in 1645, for the purpose of examining this island; which terminated in entrapping and carrying off with them sixty or seventy of the inhabitants, male and female. The former died soon after their arrival, refusing to eat any other food than coconuts, but the women, who were distributed amongst the principal families of Batavia, proved extremely tractable and docile, and acquired the language of the place. It is not stated, nor does it appear from any subsequent publication, that the opportunity was taken of forming a collection of their words.
From that period Engano had only been incidentally noticed, until in March, 1771, Mr. Richard Wyatt, then governor, and the council of Fort Marlborough, sent Mr. Charles Miller, in a vessel belonging to the Company, to explore the productions of this island. On approaching it he observed large plantations of coconut trees, with several spots of ground cleared for cultivation on the hills, and at night many fires on the beach. Landing was found to be in most parts extremely difficult on account of the surf. Many of the natives were seen armed with lances, and squatting down amongst the coral rocks, as if to conceal their numbers. Upon rowing into a bay with the ship's boat, it was pursued by ten canoes full of men, and obliged to return. Mr. Whalfeldt, the surveyor, and the second mate, proceeded to make a survey of the bay, and endeavoured to speak with the natives. They were furnished with articles for presents, and upon seeing a canoe on the beach of a small island, and several people fishing on the rocks, they rowed to the island, and sent two caffrees on shore, with some cloth, but the natives would not come near them. The mate then landed and advanced towards them, when they immediately came to him. He distributed some presents among them, and they in return gave him some fish. Several canoes came off to the ship with coconuts, sugar-cane, toddy, and a species of yam. The crew of one of them took an opportunity of un-shipping and carrying away the boat's rudder, and upon a musket being fired over their heads, many of them leaped into the sea.

Mr. Miller describes these people as being taller and fairer than the Malays; their hair black, which the men cut short, and the women wear long, and neatly turned up. The former go entirely naked, except that they sometimes throw a piece of bark of tree, or plantain leaf, over their shoulders, to protect them from the heat of the sun. The latter also are naked, except a small slip of plantain leaf round the waist; and some had on their heads fresh leaves made up nearly in the shape of a bonnet; with necklaces of small pieces of shell, and a shell hanging by a string, to be used as a comb. The ears of both men and women have large holes made in them, an inch or two in diameter, into which they put a ring made of coconut shell, or a roll of leaves. They do not chew betel. Their language was not understood by any person on board, although
SUMATRA.

there were people from most parts adjacent to the coast. Their canoes are very neat, formed of two thin planks sewn together, sharp-pointed at each end, and provided with outriggers. In general they contain six or seven men. They always carry lances, not only as offensive weapons, but for striking fish. These are about seven feet in length, formed of nibong and other hard woods; some of them tipped with pieces of bamboo made very sharp, and the concave part filled with fish-bones (and shark's teeth), others armed with pieces of bone made sharp and notched, and others pointed with bits of iron and copper sharpened. They seemed not to be unaccustomed to the sight of vessels. (Ships bound from the ports of India to the straits of Sunda, as well as those from Europe, when late in the season, frequently make the land of Engano, and many must doubtless be wrecked on its coast).

Attempts were made to find a river or fresh water, but without success, nor even a good place to land. Two of the people from the ship having pushed in among the rocks and landed, the natives soon came to them, snatched their handkerchiefs off their heads, and ran away with them, but dropt them on being pursued. Soon afterwards they sounded a conch-shell, which brought numbers of them down to the beach. The bay appeared to be well sheltered, and to afford good anchorage ground. The soil of the country, for the most part a red clay. The productions Mr. Miller thought the same as are commonly found on the coast of Sumatra; but circumstances did not admit of his penetrating into the country, which, contrary to expectation, was found to be so full of inhabitants. In consequence of the loss of anchors and cables, it was judged necessary that the vessel should return to Fort Marlborough. Having taken in the necessary supplies, the island was revisited. Finding no landing-place, the boat was run upon the coral rocks. Signs were made to the natives, who had collected in considerable numbers, and upon seeing our people land had retreated towards some houses, to stop, but to no purpose, until Mr. Miller proceeded towards them unaccompanied, when they approached in great numbers, and accepted of knives, pieces of cloth, &c. Observing a spot of cultivated ground surrounded by a sort of fence, he went to it, followed by several of the natives who made signs to deter him, and as soon as he was out of sight of
of his own people, began to handle his clothes and attempt to pull them off, when he returned to the beach.

Their houses stand singly in their plantations, are circular, about eight feet in diameter, raised about six from the ground on slender iron-wood sticks, floored with planks, and the roof, which is thatched with long grass, rises from the floor in a conical shape. No rice was seen among them, nor did they appear to know the use of it when shewn to them; nor were cattle nor fowls of any kind observed about their houses.

Having anchored off a low point of marshy land in the northern part of the bay, where the natives seemed to be more accustomed to intercourse with strangers, the party landed, in hopes of finding a path to some houses about two miles inland. Upon observing signs made to them by some people on the coral-reef, Mr. Miller and Mr. Whalfeldt went towards them in the sampan, when some among them took an opportunity of stealing the latter's hanger and running away with it; upon which they were immediately fired at by some of the party, and notwithstanding Mr. Miller's endeavours to prevent them, both the officer and men continued to fire upon and pursue the natives through the morass, but without being able to overtake them. Meeting, however, with some houses, they set fire to them, and brought off two women and a boy, whom the caffrees had seized. The officers on board the vessel, alarmed at the firing, and seeing Mr. Miller alone in the sampan, whilst several canoes full of people were rowing towards him, sent the pinnace with some sepoys to his assistance. During the night, conch-shells were heard to sound almost all over the bay, and in the morning several large parties were observed on different parts of the beach. All further communication with the inhabitants being interrupted by this imprudent quarrel, and the purposes of the expedition thereby frustrated, it was not thought advisable to remain any longer at Engano, and Mr. Miller, after visiting some parts of the southern coast of Sumatra, returned to Fort Marlborough.
SUMATRA.

Po. Mega. The next island to the north-west of Engano, but at a considerable distance, is called by the Malays Pulo Mega (cloud-island), and by Europeans Triste, or isle de Recif. It is small and uninhabited, and, like many others in these seas, is nearly surrounded by a coral-reef, with a lagune in the centre. Coconut trees grow in vast numbers in the sand near the sea-shore, whose fruit serves for food to rats and squirrels, the only quadrupeds found there. On the borders of the lagune is a little vegetable mould, just above the level of high water, where grow some species of timber-trees.

Po. Sanding. The name of Pulo Sanding or Sandiang, belongs to two small islands situated near the south-eastern extremity of the Nassau or Pagi islands, in which group they are sometimes included. Of these the southernmost is distinguished in the Dutch charts by the term of Laeg or low, and the other by that of Bergen or hilly. They are both uninhabited, and the only productions worth notice is the long nutmeg, which grows wild on them, and some good timber, particularly of the kind known by the name of marbau (metrosideros amboinensis.) An idea was entertained of making a settlement on one of them, and in 1769 an officer with a few men were stationed there for some months, during which period the rains were incessant. The scheme was afterwards abandoned as unlikely to answer any useful purpose.

Nassaus or Po. Pagi. The two islands separated by a narrow strait, to which the Dutch navigators have given the name of the Nassaus, are called by the Malays Po. Pagi or Pagei, and by us commonly the Pogies. The race of people by whom these as well as some other islands to the northward of them are inhabited, having the appellation of orang mantawe, this has been confounded with the proper names of the islands, and being applied sometimes to one and sometimes to another, has occasioned much confusion and uncertainty. The earliest accounts we have of them are the reports of Mr. Randolph Marriot in 1749, and of Mr. John Saul in 1750 and 1751, with Capt. Thomas Forrest’s observations in 1757, preserved in Mr. Dalrymple’s “Historical Relation of the several Expeditions from Fort Marlborough to the Islands adjacent to the West-coast of Sumatra;” but
but by much the most satisfactory information is contained in a paper communicated by Mr. John Crisp to the Asiatic Society of Bengal, in the sixth volume of whose Transactions it is published, and from these documents I shall extract such particulars as may best serve to convey a knowledge of the country and the people.

Mr. Crisp sailed from Fort Marlborough on the 12th of August, 1792, in a vessel navigated at his own expense, and with no other view than that of gratifying a liberal curiosity. On the 14th he anchored in the straits of See Cockup (Si Kakap), which divide the Northern from the Southern Pagi. These straits are about two miles in length and a quarter of a mile over, and make safe riding for ships of any size, which lie perfectly secure from every wind, the water being literally as smooth as in a pond. The high land of Sumatra (inland of Moco-moco and Ipu) was plainly to be distinguished from thence. In the passage are scattered several small islands, each of which consists of one immense rock, and which may have been originally connected with the main island. The face of the country is rough and irregular, consisting of high hills of sudden and steep ascent, and covered with trees to their summits, among which the species called bintanigur or puhn, fit for the largest masts, abounds. The sago tree grows in plenty, and constitutes the chief article of food to the inhabitants, who do not cultivate rice. The use of betel is unknown to them. Coconut trees, bamboos, and the common fruits of Sumatra, are found here. The woods are impervious to man: the species of wild animals that inhabit them, but few; the large red deer, hogs, and several kinds of monkey, but neither buffaloes nor goats; nor are they infested with tigers or other beasts of prey. They have the common domestic fowl; but pork and fish are the favourite animal food of the natives.

When the vessel had been two days at anchor, they began to come down from their villages in their canoes, bringing fruit of various kinds, and on invitation they readily came on board, without shewing signs of apprehension or embarrassment. On presenting to them plates of boiled rice, they would not touch it until it had been previously tasted by one of
of the ship's company. They behaved whilst on board with much decorum, shewed a strong degree of curiosity, but not the least disposition for pilfering. They appeared to live in great friendship and harmony with each other, and voluntarily divided amongst their companions what was given to them. Their stature seldom exceeds five feet and a half. Their colour is like that of the Malays, a light brown or copper-colour. Some canoes came alongside the vessel with only women in them, and upon being encouraged by the men, several ventured on board. When on the water they use a temporary dress to shield them from the heat of the sun, made of the leaves of the plantain, of which they form a sort of conical cap (the same was observed of the women of Engano), and there is also a broad piece of the leaf fastened round the body over their breasts, and another round their waist. This leaf readily splits, and has the appearance of a coarse fringe. When in their villages, the women, like the men, wear only a small piece of coarse cloth, made of the bark of a tree, round their middle. Beads and other ornaments are worn about the neck. Although coconuts are in such plenty, they have not the use of oil, and their hair, which is black, and naturally long, is, for want of it and the use of combs, in general matted and full of vermin. They have a method of filing or grinding their teeth to a point, like the people of Sumatra.

The number of inhabitants of the two islands is supposed not to exceed 1400 persons. They are divided into small tribes, each occupying a small river, and living in one village. On the southern island are five of these villages, and on the northern seven, of which Kakap is accounted the chief, although Labu-labu is supposed to contain the greater number of people. Their houses are built of bamboos and raised on posts; the under part is occupied by poultry and hogs, and, as may be supposed, much filth is collected there. Their arms consist of a bow and arrows. The former is made of the nibong tree, and the string of the entrails of some animal. The arrows are of small bamboo, headed with brass or with a piece of hard wood cut to a point. With these they kill deer, which are roused by dogs of a mongrel breed, and also monkeys, whose flesh they eat. Some among them wear kries. It was said, that the different
different tribes of *orang mantawei* who inhabit these islands, never make war upon each other, but with people of islands to the northward they are occasionally in a state of hostility. The measurement of one of their war-canoes, preserved with great care under a shed, was twenty-five feet in the length of the floor, the prow projecting twenty-two, and the stern eighteen, making the whole length sixty-five feet. The greatest breadth was five feet, and the depth three feet eight inches. For navigating in their rivers and the straits of *Si Kakap*, where the sea is as smooth as glass, they employ canoes, formed, with great neatness, of a single tree, and the women and young children are extremely expert in the management of the paddle. They are strangers to the use of coin of any kind, and have little knowledge of metals. The iron bill or chopping-knife, called *paráng*, is in much esteem among them, it serves as a standard for the value of other commodities, such as articles of provision.

The religion of these people, if it deserves the name, resembles much what has been described of the *Battas*; but their mode of disposing of their dead is different, and analogous rather to the practice of the Southsea islanders; the corpse being deposited on a sort of stage, in a place appropriated for the purpose, and with a few leaves strewed over it, is left to decay. Inheritance is by male descent; the house or plantation, the weapons and tools of the father, become the property of the sons. Their chiefs are but little distinguished from the rest of the community by authority or possessions, their pre-eminence being chiefly displayed at public entertainments, of which they do the honours. They have not even judicial powers, all disputes being settled, and crimes adjudged, by a meeting of the whole village. Murder is punishable by retaliation, for which purpose the offender is delivered over to the relations of the deceased, who may put him to death; but the crime is rare. Theft, when to a considerable amount, is also capital. In cases of adultery the injured husband has a right to seize the effects of the paramour, and sometimes punishes his wife by cutting off her hair. When the husband offends, the wife has a right to quit him and to return to her parents' house. Simple fornication between unmarried persons, is neither considered
considered as a crime nor a disgrace. The state of slavery is unknown among these people; and they do not practise circumcision.

The custom of tattooing, or imprinting figures on the skin, is general among the inhabitants of this group of islands. They call it in their language teetee or titi. They begin to form these marks on boys at seven years of age, and fill them up as they advance in years. Mr. Crisp thinks they were originally intended as marks of military distinction. The women have a star imprinted on each shoulder, and generally some small marks on the backs of their hands. These punctures are made with an instrument consisting of a brass-wire fixed perpendicularly into a piece of stick about eight inches in length. The pigment made use of is the smoke collected from dammar, mixed with water (or, according to another account, with the juice of the sugar-cane). The operator takes a stalk of dried grass, or a fine piece of stick, and dipping the end in the pigment, traces on the skin the outline of the figure, and then dipping the brass point in the same preparation, with very quick and light strokes of a long, small stick, drives it into the skin, whereby an indelible mark is produced. The pattern, when completed, is in all the individuals nearly the same.

In the year 1783 the son of a raja of one of the Pagi islands came over to Sumatra, on a visit of curiosity, and being an intelligent man, much information was obtained from him. He could give some account of almost every island that lies off the coast, and when a doubt arose about their position, he ascertained it by taking the rind of a pumplenose or shaddock, and breaking it into bits of different sizes, disposing them on the floor in such a manner as to convey a clear idea of the relative situation. He spoke of Engano (by what name is not mentioned) and said that their boats were sometimes driven to that island, on which occasions they generally lost a part, if not the whole, of their crews, from the savage disposition of the natives. He appeared to be acquainted with several of the constellations, and gave names for the pleiades, scorpion, great bear, and Orion's belt. He understood the distinction between the fixed and wandering stars, and particularly noticed Venus, which
which he named *usutat-si-geb-geb* or planet of the evening. To Sumatra he gave the appellation of *Seraihu*. As to religion, he said the rajas alone prayed and sacrificed hogs and fowls. They addressed themselves in the first place to the Power above the sky; next, to those in the moon, who are male and female; and lastly, to that evil being, whose residence is beneath the earth, and is the cause of earthquakes. A drawing of this man, representing accurately the figures in which his body and limbs were tattooed, was made by Colonel Trapaud, and obligingly given to me. He not only stood patiently during the performance, but seemed much pleased with the execution, and proposed that the Colonel should accompany him to his country to have an opportunity of making a likeness of his father. To our collectors of rare prints it is well known that there exists an engraving of a man of this description by the title of the "painted prince," brought to England by Capt. Dampier, from one of the islands of the eastern sea, in the year 1691, and of whom a particular account is given in his *Voyage*. He said that the inhabitants of the *Pagi* islands derived their origin from the *orang mantawe* of the island called *Si Biru*.

North-westward of the *Pagi* islands, and at no great distance, lies that of *Si Porah*, commonly denominated Good Fortune island, inhabitated by the same race as the former, and with the same manners and language. The principal towns or villages are named *Si Porah*, containing, when visited by Mr. John Saul in 1750, three hundred inhabitants, *Si Labah* three hundred, (several of whom were originally from the neighbouring island of *Nias*) *Si Bagau* two hundred, and *Si Uban* a smaller number; and when Capt. Forrest made his inquiries in 1757, there was not any material variation. Since that period, though the island has been occasionally visited, it does not appear that any report has been preserved of the state of the population. The country is described as being entirely covered with wood. The highest land is in the vicinity of *Si Labah*.

The next island in the same direction is named *Si Biru*, which although of considerable size, being larger than *Si Porah*, has commonly been
SUMATRA.

been omitted in our charts, or denoted to be uncertain. It is inhabited by the mantavei race, and the natives both of Si Porah and the Pagi islands consider it as their parent-country, but notwithstanding this connexion, they are generally in a state of hostility, and in 1783 no intercourse subsisted between them. The inhabitants are distinguished only by some small variety of the patterns in which their skins are tattooed, those of Si Biru having them narrower on the breast and broader on the shoulders. The island itself is rendered conspicuous by a volcano-

Next to this is Pulo Batu, situated immediately to the southward of the equinoctial line, and, in consequence of an original mistake in Valentyn's erroneous chart, published in 1726, usually called by navigators, Mintaon, being a corruption of the word mantavei, which, as already explained, is appropriated to a race inhabiting the islands of Si Biru, Si Porah, and Pagi. Batu, on the contrary, is chiefly peopled by a colony from Nias. These pay a yearly tax to the raja of Buluaro, a small kampong in the interior part of the island, belonging to a race different from both, and whose number, it is said, amounts only to one hundred, which it is not allowed to exceed, so many children being reared as may replace the deaths. They are reported to bear a resemblance to the people of Makasar or Bugis, and may have been adventurers from that quarter. The influence of their raja over the Nias inhabitants, who exceed his immediate subjects in the proportion of twenty to one, is founded on the superstitious belief, that the water of the island will become salt when they neglect to pay the tax. He in his turn, being in danger from the power of the Malay traders who resort thither from Padang, and are not affected by the same superstition, is constrained to pay them to the amount of sixteen ounces of gold as an annual tribute.

The food of the people, as in the other islands, is chiefly sago, and their exports coconuts, oil in considerable quantities, and stvala or sea-slugs. No rice is planted there, nor, if we may trust to the Malayan accounts, suffered to be imported. Upon the same authority also we are told, that the island derives its name of Batu from a large rock resembling
SUMATRA.

Semitling the hull of a vessel, which tradition states to be a petrifaction of that in which the Buluaro people arrived. The same fanciful story of a petrified boat is prevalent in the Serampei country of Sumatra. From Natal hill P°. Batu is visible. Like the islands already described, it is entirely covered with wood.

Between Pulo Batu and the coast of Sumatra, but much nearer to the latter, is a small uninhabited island, called Pulo Kapini (iron-wood island), but to which our charts (copying from Valentyn) commonly give the name of Batu, whilst to Batu itself, as above described, is assigned the name of Mintaon. In confirmation of the distinctions here laid down, it will be thought sufficient to observe, that when the Company’s packet, the Greyhound, lay at what was called Lant’s bay in Mintaon, an officer came to our settlement of Natal (of which Mr. John Marsden at that time was chief) in a Batu oil-boat; and that a large trade for oil is carried on from Padang and other places with the island of Batu, whilst that of Kapini is known to be without inhabitants, and could not supply the article.

The most productive and important, if not the largest of this chain of islands, is Pulo Nias. Its inhabitants are very numerous, and of a race distinct not only from those on the main (for such we must relatively consider Sumatra), but also from the people of all the islands to the southward, with the exception of the last-mentioned. Their complexions, especially the women, are lighter than those of the Malays; they are smaller in their persons and shorter in stature; their mouths are broad, noses very flat, and their ears are pierced and distended in so extraordinary a manner as nearly, in many instances, to touch the shoulders, particularly when the flap has, by excessive distension or by accident, been rent asunder; but these pendulous excrescences are commonly trimmed and reduced to the ordinary size, when they are brought away from their own country. Preposterous, however, as this custom may appear, it is not confined to the Nias people. Some of the women of the inland parts of Sumatra, in the vicinity of the equinoctial line (especially those of the Rau tribes) increase the perforation of their ears, until they admit ornaments of two or three inches diameter. There is no circumstance

3 P 2
by which the natives of this island are more obviously distinguished than
the prevalence of a leprous scurf, with which the skins of a great pro-
portion of both sexes are affected; in some cases covering the whole of
the body and limbs, and in others resembling rather the effect of the
tetter or ring-worm, running like that partial complaint in waving lines
and concentric curves. It is seldom, if ever, radically cured, although
by external applications (especially in the slighter cases) its symptoms
are moderated, and a temporary smoothness given to the skin; but it
does not seem in any stage of the disease to have a tendency to shorten
life, or to be inconsistent with perfect health in other respects, nor is
there reason to suppose it infectious; and it is remarkable, that the in-
habitants of P^o. Batu, who are evidently of the same race, are exempt
from this cutaneous malady. The principal food of the common people
is the sweet potato, but much pork is also eaten by those who can afford
it, and the chiefs make a practice of ornamenting their houses with the
jaws of the hogs, as well as the skulls of the enemies whom they slay.
The cultivation of rice has become extensive in modern times, but rather
as an article of traffic than of home consumption.

These people are remarkable for their docility and expertness in handycraft work, and become excellent house-carpenters and joiners, and as
an instance of their skill in the arts, they practise that of letting blood
by cupping, in a mode nearly similar to ours. Among the Sumatrans
blood is never drawn with so salutary an intent. They are industrious
and frugal, temperate and regular in their habits, but at the same time
avaricious, sullen, obstinate, vindictive, and sanguinary. Although
much employed as domestic slaves (particularly by the Dutch) they are
always esteemed dangerous in that capacity; a defect in their char-
acter which philosophers will not hesitate to excuse in an independent
people torn by violence from their country and connexions. They
frequently kill themselves when disgusted with their situation or un-
happy in their families, and often their wives at the same time, who
appeared, from the circumstances under which they were found, to have
been consenting to the desperate act. They were both dressed in their
best apparel (the remainder being previously destroyed), and the female,
in more than one instance that came under notice, had struggled so
little,
SUMATRA.

little, as not to discompose her hair, or remove her head from the pillow. It is said, that in their own country they expose their children, by suspending them, in a bag, from a tree, when they despair of being able to bring them up. The mode seems to be adopted with the view of preserving them from animals of prey, and giving them a chance of being saved by persons in more easy circumstances.

The island is divided into about fifty small districts, under chiefs or rajas, who are independent of, and at perpetual variance with, each other; the ultimate object of their wars being to make prisoners, whom they sell for slaves, as well as all others not immediately connected with them, whom they can seize by stratagem. These violences are doubtless encouraged by the resort of native traders from Padang, Natal, and Achin, to purchase cargoes of slaves, who are also accused of augmenting the profits of their voyage, by occasionally surprising and carrying off whole families. The number annually exported is reckoned at four hundred and fifty to Natal, and one hundred and fifty to the northern ports (where they are said to be employed by the Achinese in the gold-mines), exclusive of those which go to Padang, for the supply of Batavia, where the females are highly valued, and taught music and various accomplishments. In catching these unfortunate victims of avarice, it is supposed that not fewer than two hundred are killed; and if the aggregate be computed at one thousand, it is a prodigious number to be supplied from the population of so small an island.

Beside the article of slaves, there is a considerable export of padi and rice, the cultivation of which is chiefly carried on at a distance from the sea-coasts, whither the natives retire, to be secure from piratical depredations, bringing down the produce to the harbours (of which there are several good ones), to barter with the traders for iron, steel, beads, tobacco, and the coarser kinds of Madras and Surat piece-goods. Numbers of hogs are reared, and some parts of the main, especially Barus, are supplied from hence with yams, beans, and poultry. Some of the rajas are supposed to have amassed a sum equal to ten or twenty thousand dollars, which is kept in ingots of gold and silver, much of the latter,
latter, consisting of small Dutch money (not the purest coin) melted down; and of these they make an ostentatious display at weddings and other festivals.

The language scarcely differs more from the Battá and the Lampong than these do from each other, and all evidently belong to the same stock. The pronunciation is very guttural, and either from habit or peculiar conformation of organs, these people cannot articulate the letter p, but in Malayan words, where the sound occurs, pronounce it as f, (saying, for example, fulo finang, instead of Pulo Pinang); whilst, on the contrary, the Malays never make use of the f, and pronounce as pikir the Arabic word jikir. Indeed, the Arabians themselves appear to have the same organic defect as the people of Nias, and it may likewise be observed in the languages of some of the South-sea islands.

On the western side of Nias, and very near to it, is a cluster of small islands, called Po. Nako-nako, whose inhabitants (as well as others who shall presently be noticed) are of a race termed Maros or orang maruwi, distinct from those of the former, but equally fair-complexioned. Large quantities of coconut-oil are prepared here, and exported chiefly to Padang, the natives having had a quarrel with the Natal traders. The islands are governed by a single raja, who monopolizes the produce, his subjects dealing only with him, and he with the praws or country vessels, who are regularly furnished with cargoes in the order of their arrival, and never dispatched out of turn.

Pulo Babi or Hog island, called by the natives Si Malu, lies north-westward from Nias, and, like Nako-Nako, is inhabited by the Maruwi race. Buffaloes (and hogs, we may presume) are met with here in great plenty, and sold cheap.

The name of Pulo Baniak belongs to a cluster of islands (as the terms imply) situated to the eastward, or in-shore of Po. Babi, and not far from the entrance of Sinigkel river. It is, however, most commonly applied to one of them which is considerably larger than the others. It does not appear to furnish any vegetable produce as an article of
of trade, and the returns from thence are chiefly sea-slug and the
edible bird’s-nest. The inhabitants of these islands also are Maruvis,
and, as well as the others of the same race, are now Mahometans.
Their language, although considered by the natives of these parts as
distinct and peculiar, (which will naturally be the case where people do
not understand each other’s conversation), has much radical affinity to
the Batta and Nias, and less to the Pagi; but all belong to the same
class, and may be regarded as dialects of a general language prevailing
amongst the original inhabitants of this eastern archipelago, as far at
least as the Moluccas and Philippines.

THE END.

INDEX.
INDEX.

A.

Achin-head, situation of, 2.

Address, custom of, in the third, instead of the second person, 287.
